Communication Problem :-

Date __/__/____ Page No.: ____

37 Domain name Resolution:-
when we hit any url into the browser, it's whole sole responsibility of operating system to identify the ip address corresponding to that url.

Step 1:- Operating system will redirect this call to local name resolver to fetch the IP address of requested url.

Step 2nd:- local name resolver will first look up into its local cache to find out the entry else it will directly contact to network name resolver.

Step 3rd:- Network name resolver will contact to the next.
So, Network name resolver will contact one of all 13 root server to find out the ip address of the url.

Step 4th:- Root server will not directly fullfil the request raised by network name server it will re-direct the request to one of top level domain name server.

step 5th:- So Top level domain name server will re-direct this request to some set of local servers which contain information about that url.
It might be possible that multiple

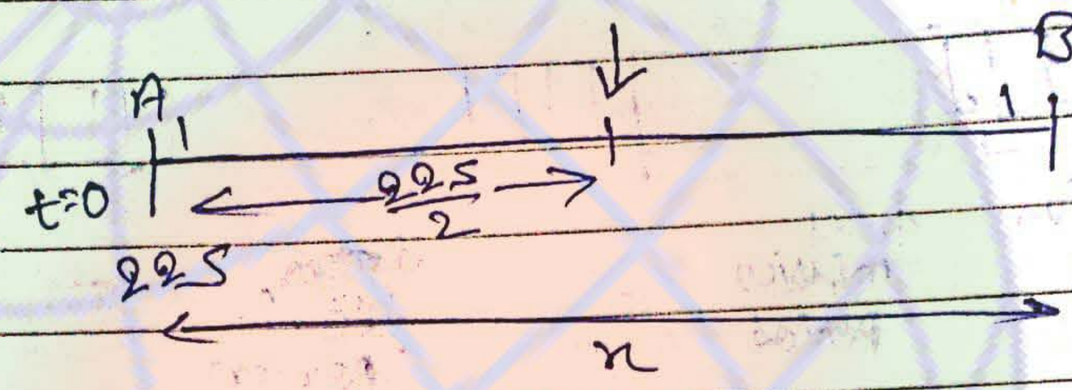
Q) Suppose node A and B are on the same 10 mbps ethernet segment and propagation delay b/w the two node is 225 bit time. suppose A and B send frame at t=0 the frame collides then at what time A or B finish this transmitting A jamp signal. Assume that jamp signal is 48 bit

Sol^n



$$\frac{225}{2} + \frac{225}{2} + 48 = 225 + 48$$
$$= 273$$

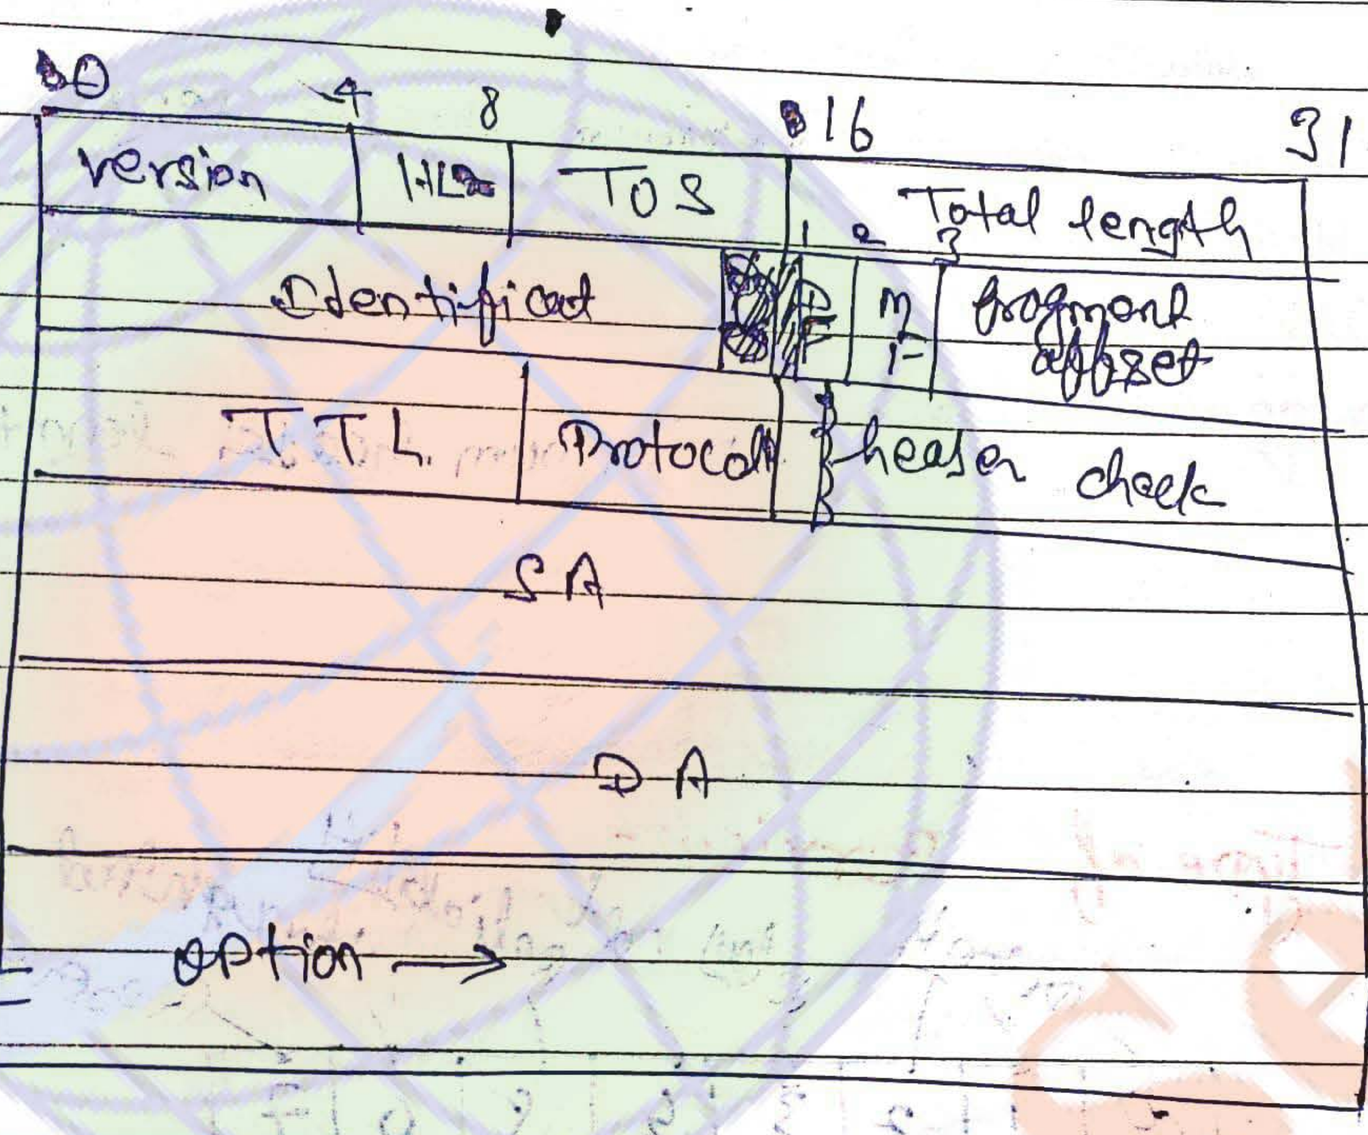
273
225

Network layer:-

① IP:- (Internet Protocol)

Protocols:- IP, ICMP, IGMP, ARP, RARP, BGP, OSPL, RIP

② IP header formate:-



(i) Version:- The version field will keep track of which version of the protocol, the datagram belong's to.

eg IV4 version or IP6 version.

(ii) Header length:- It is used to know the length of the header. It is of 4-bit and each number in header length indicates 4-byte word. So if header length is equal to

"Do not say, 'It is morning,' and dismiss it with a name of yesterday. See it for the first time as a newborn child that has no name." —Rabindranath Tagore

Date __/__/____ Page No.:

to 5.

0000
0001
0011
0100
0101

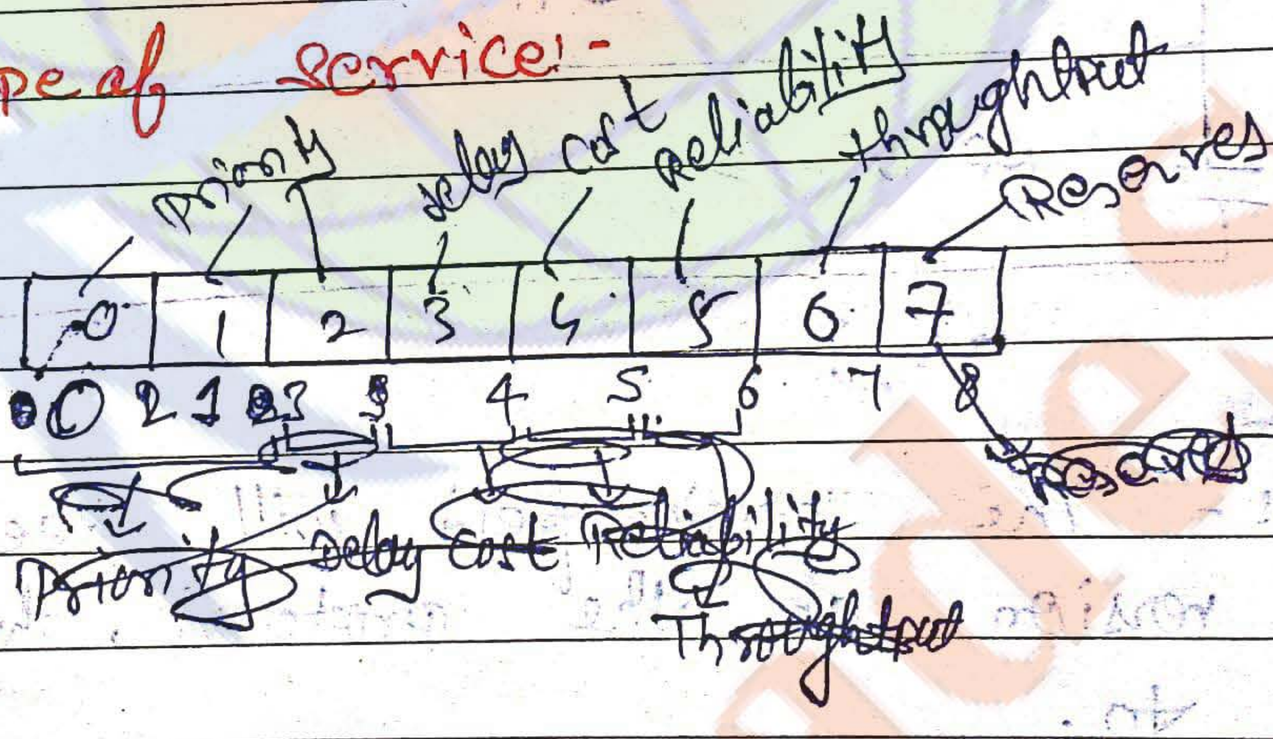
minimum = 20 Byte

✓ maximum header length = 11111
= 15 x 4
= 60 byte

✓ minimum header length = 0101
= 5 x 4
= 20 byte

= 5 x 4 Byte
= 20 Bytes.

- Type of service:-

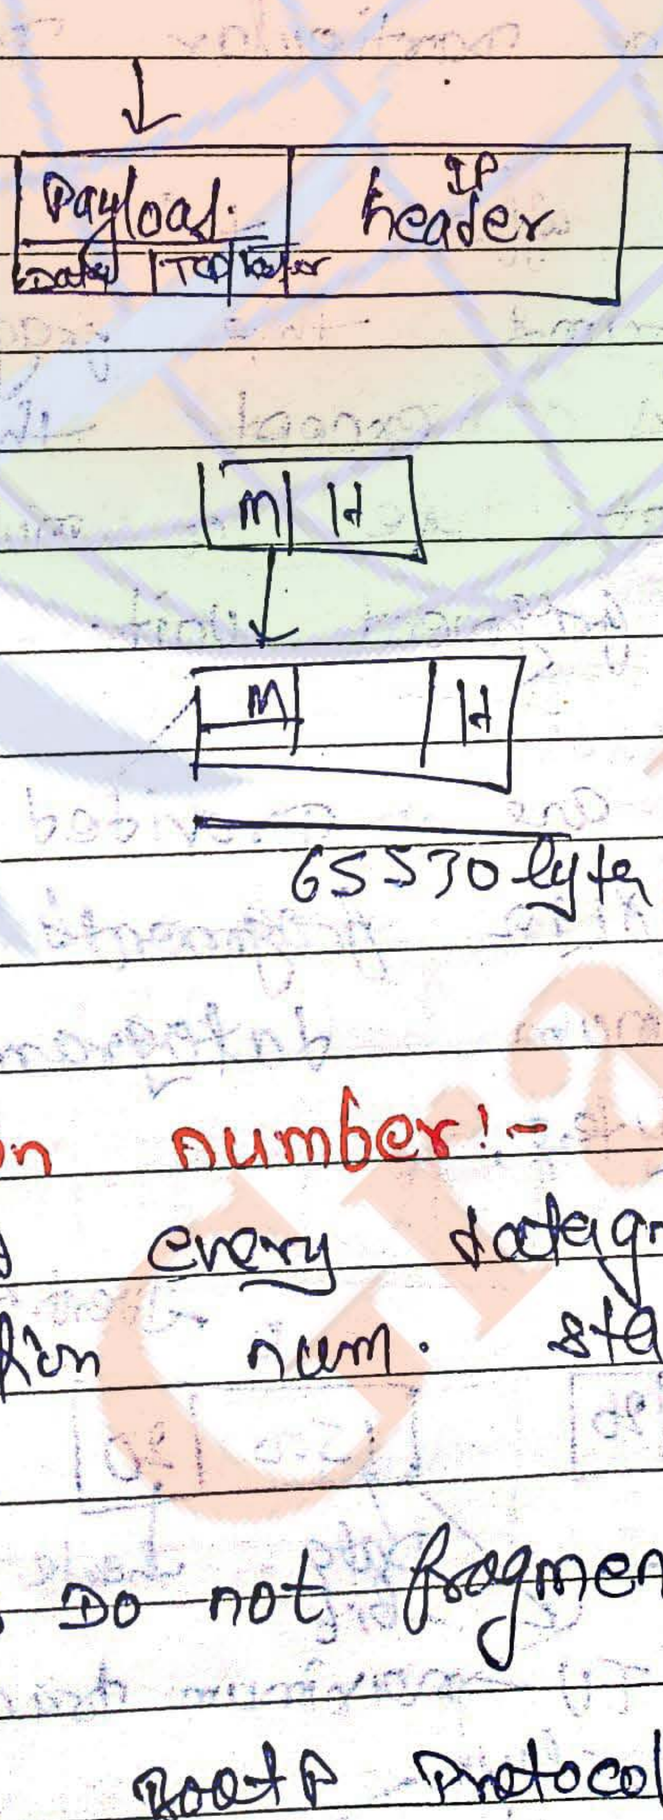


If more than one packet's are accumulated at router and router need's to pin up their buffer in that case packet having less priority will get discarded.
of delay bit is set to 1, that mean's that the packet in such a way

Date ___/___/_____ Page No.: _____

that the delay is less.
If cost bit is equal to 1, then choose the root for packet which gives less cost and
same with reliability and throughput.

- **Total length:-** A total length includes everything in the datagram both header and data the maximum length is 2^{16} which is 65,535 bytes. at present this upper limit is tolerable but with future gigabit networks larger datagram's may be needed.

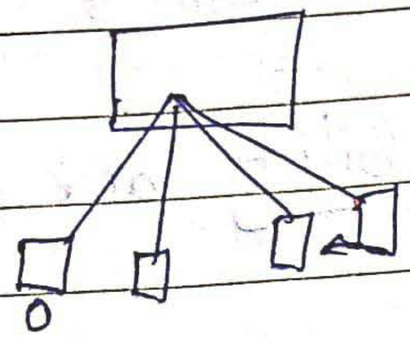


- **Identification number:-** each and every datagram will use a an identification num. starting from 0 to 64k.

Note: D / F ⇒ Do not fragment

Boot P Protocol

M
F → more fragments.

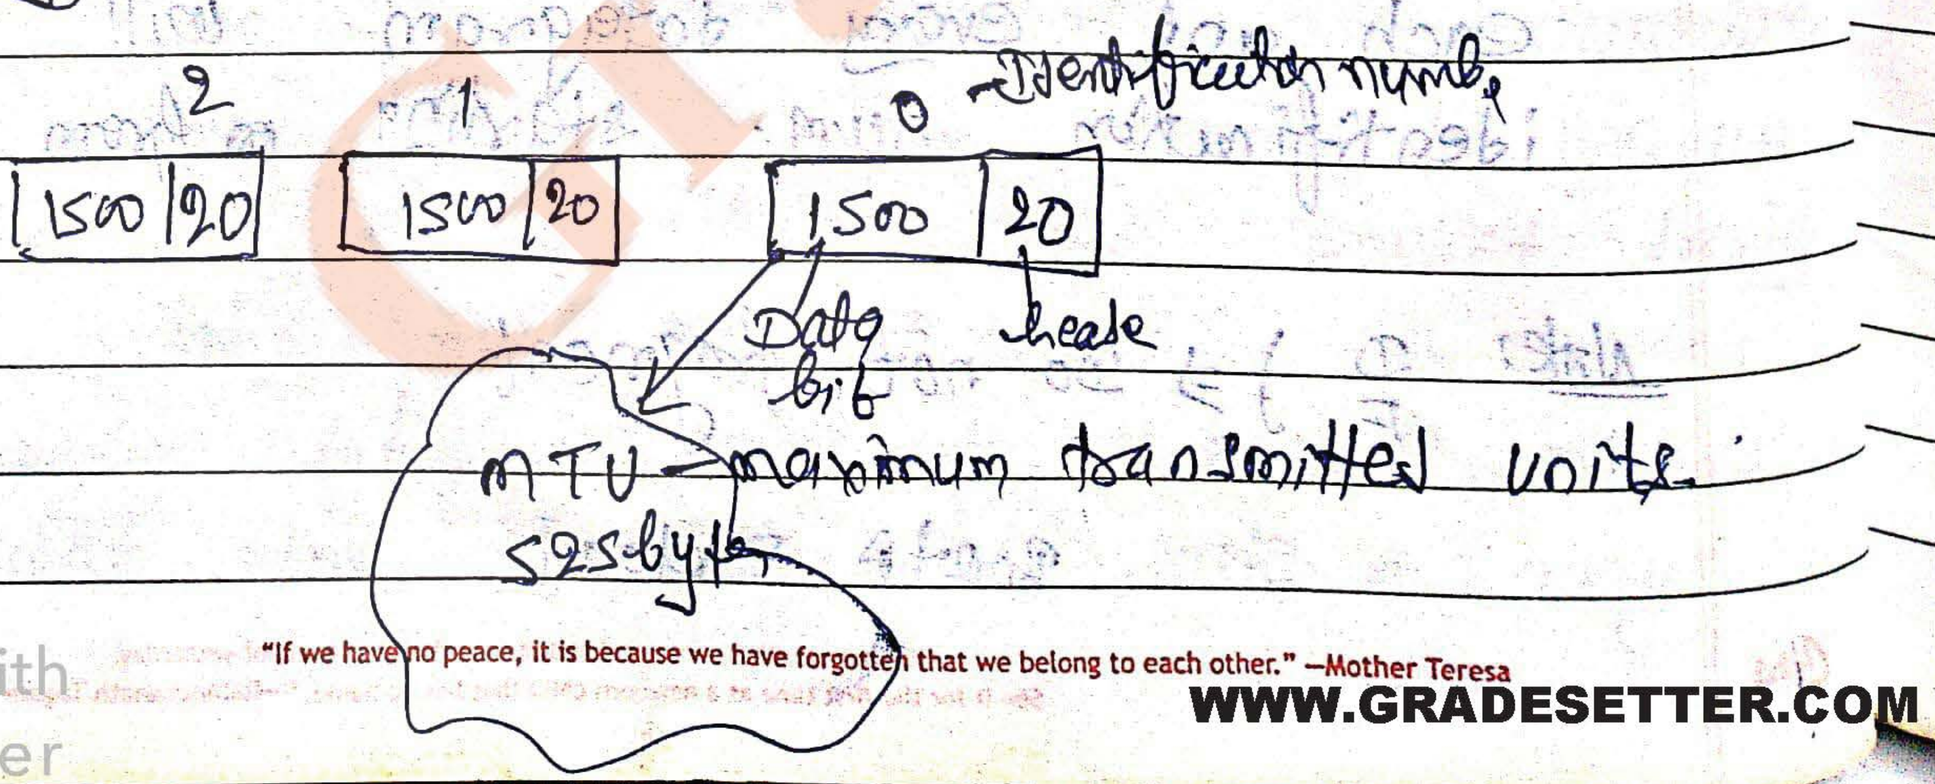


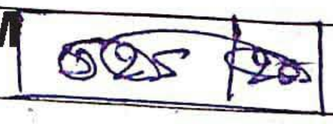
0
(when MF bit is zero then it means it is last bit.)

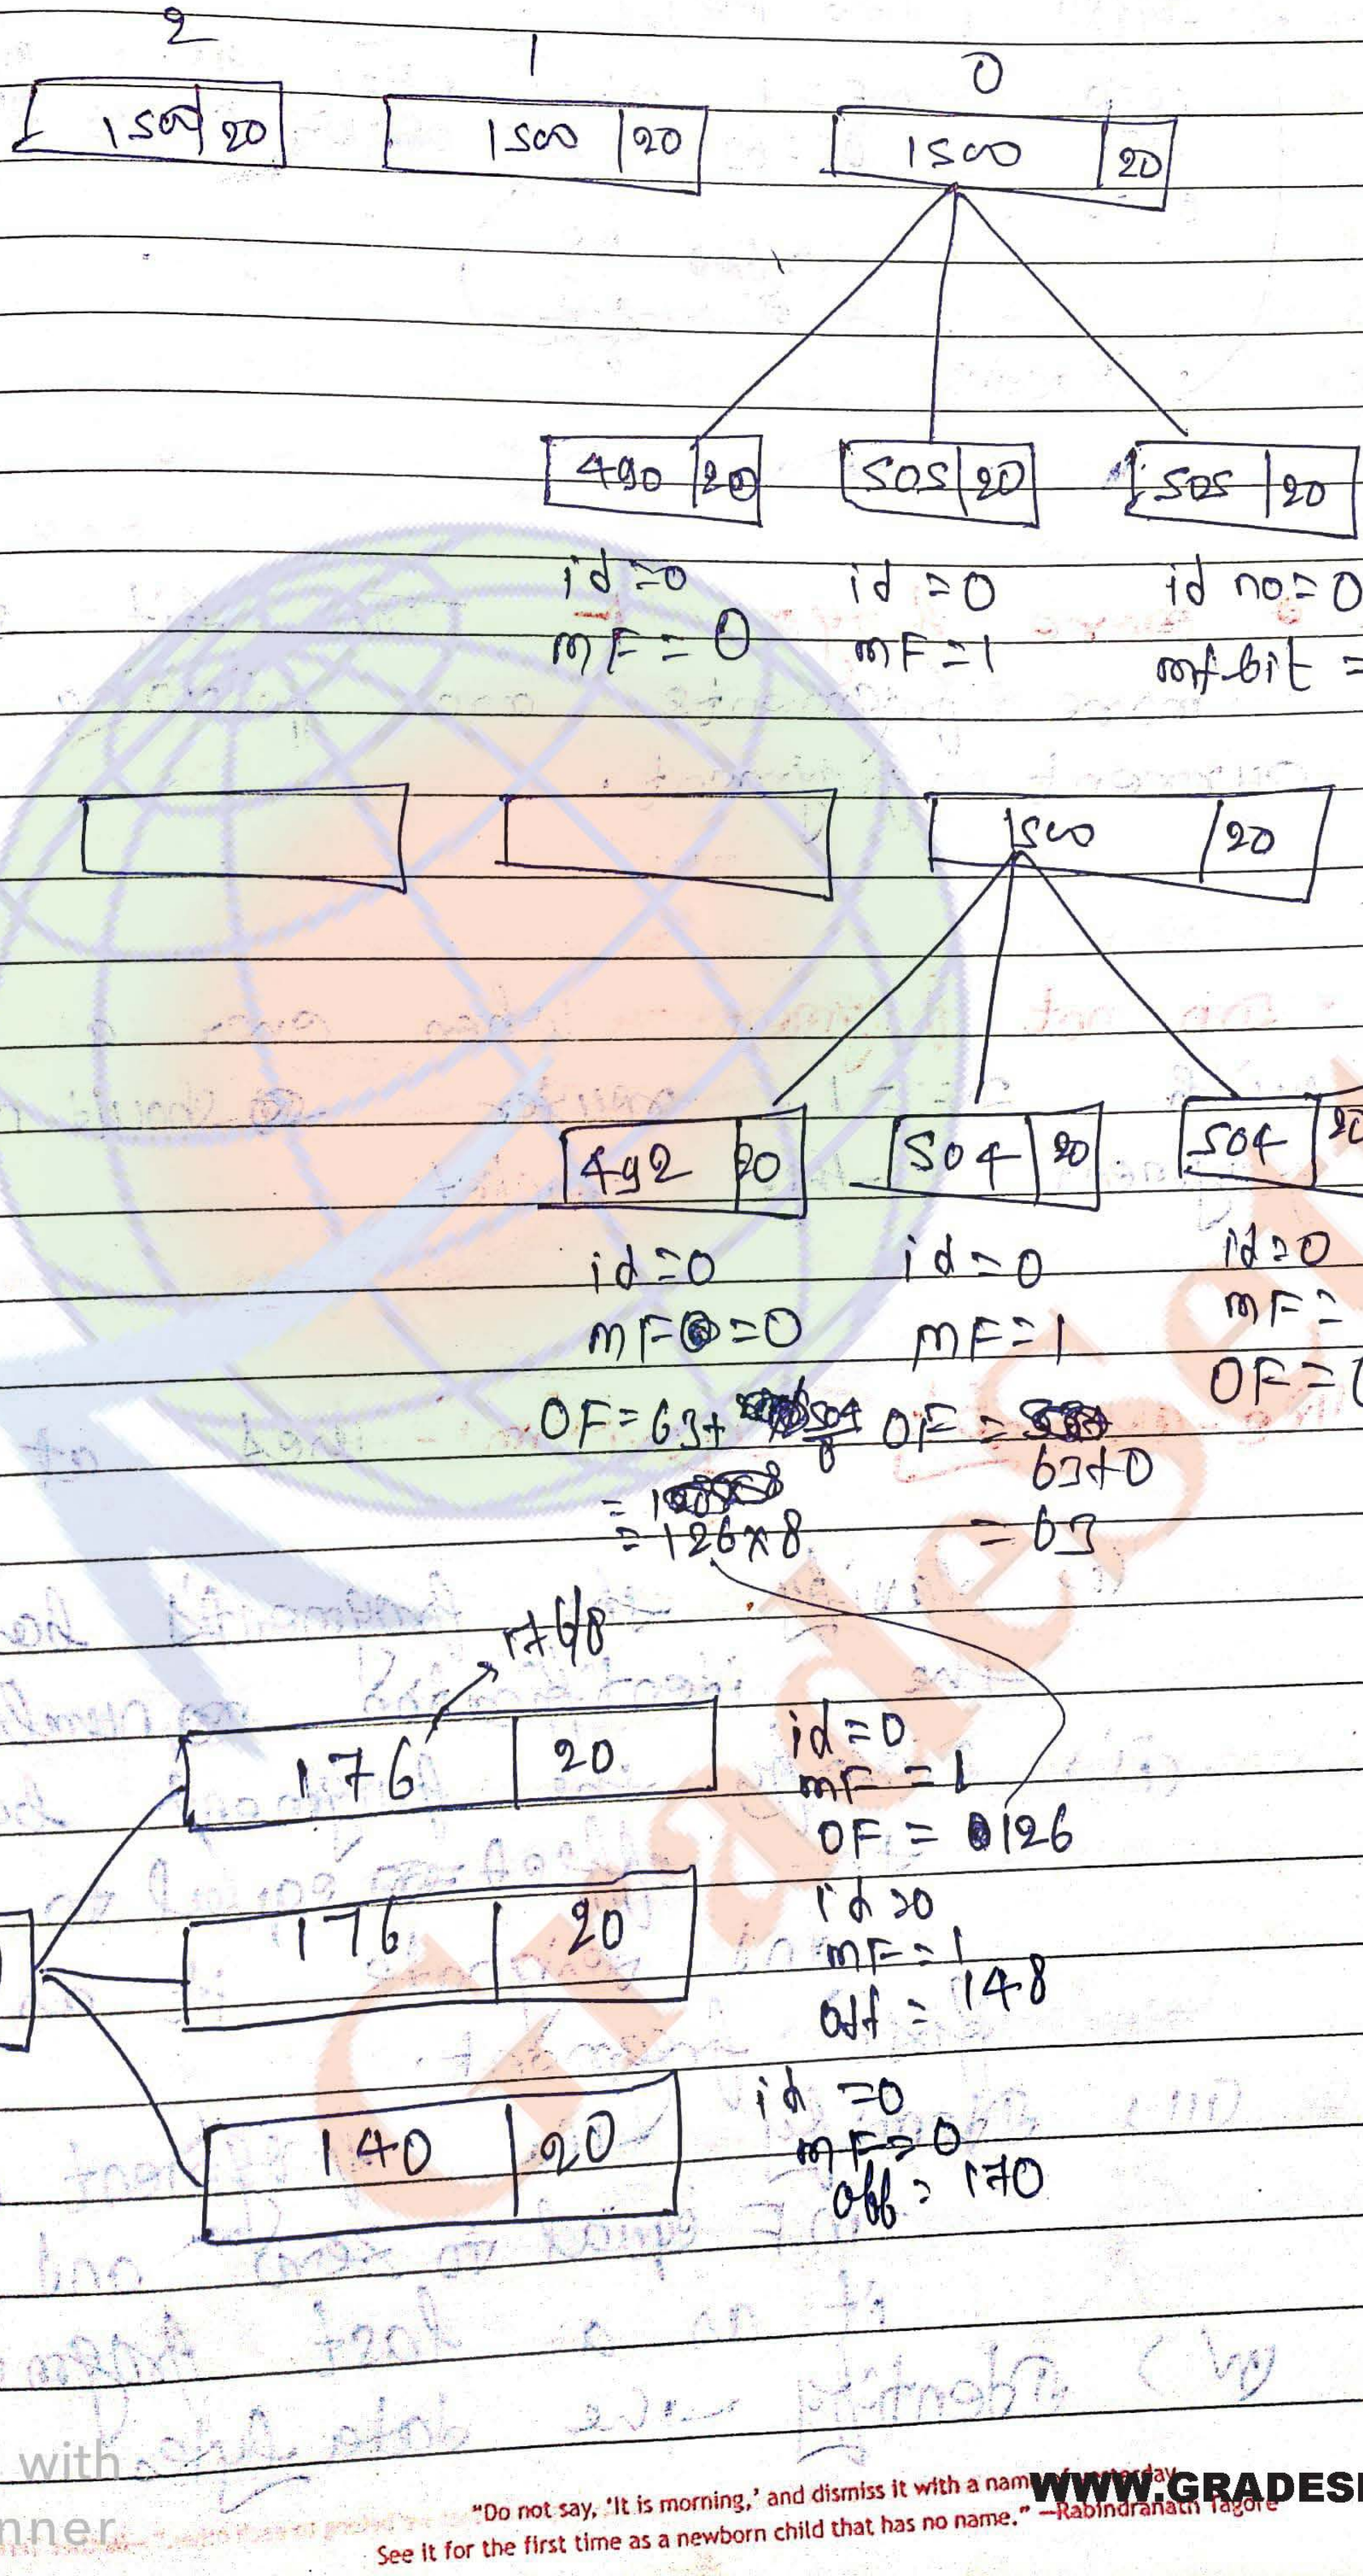
- **offset:-** This field is used to know how many data bytes are ahead of this fragment in a particular packet.

The fragment offset tells where in the current datagram this fragment belongs. All fragments except the last one in a datagram must be a multiple of 8 bytes, the elementry fragment unit.

Since 13 bits are provided, there is a maximum of 8192 fragments per datagram giving a maximum datagram length of 65536 bytes.



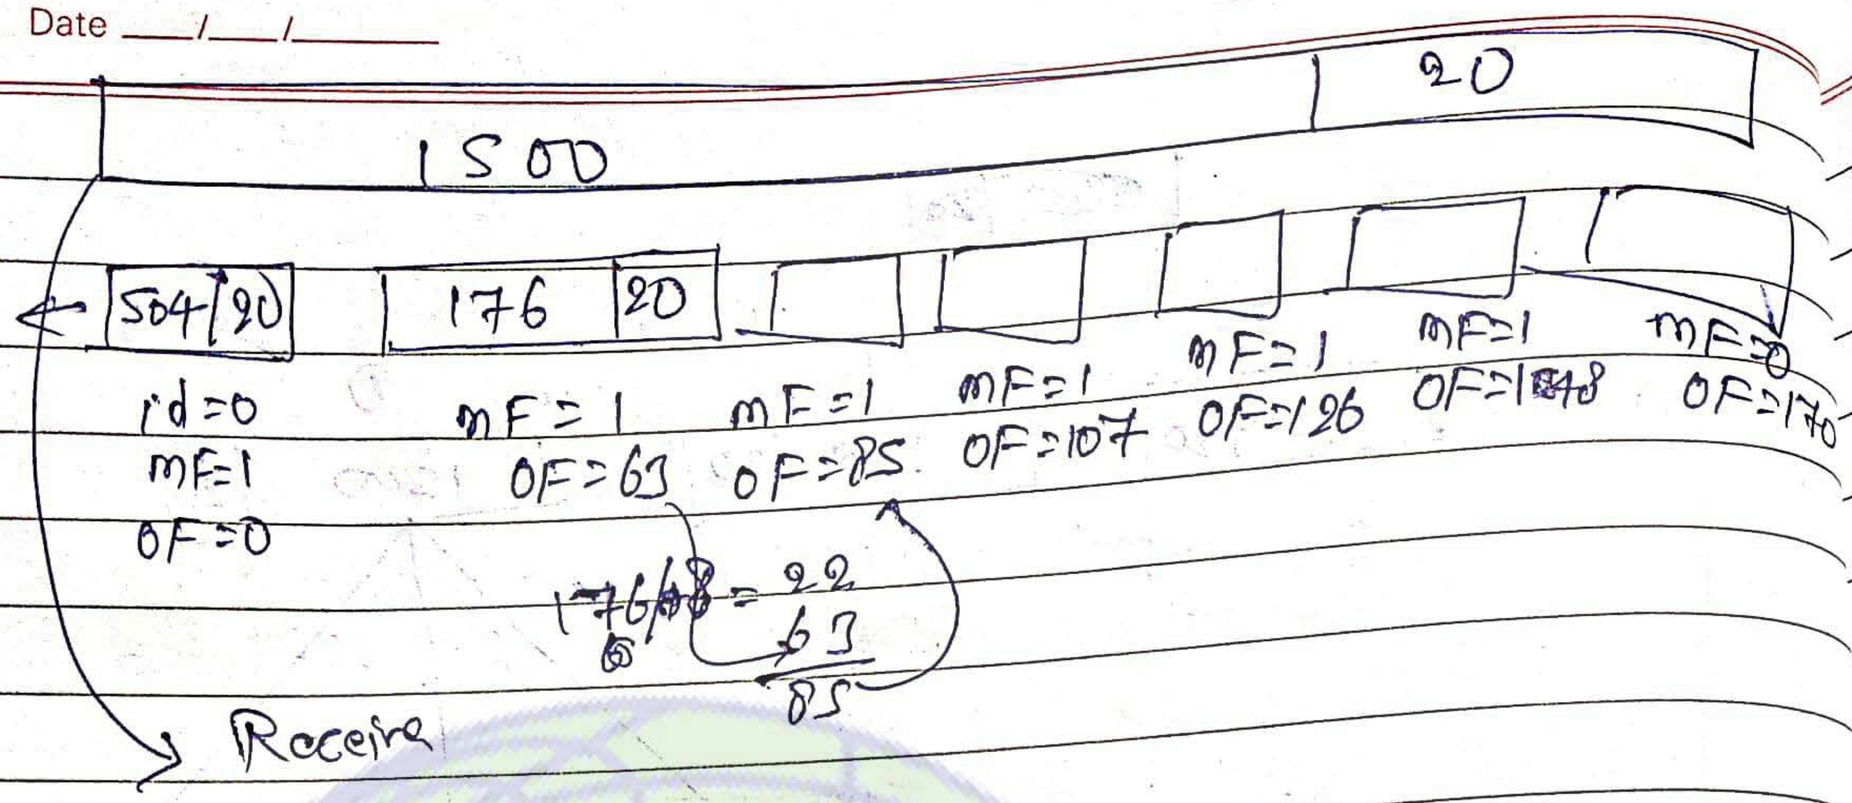




"Do not say, 'It is morning,' and dismiss it with a name of yesterday. See it for the first time as a newborn child that has no name." —Rabindranath Tagore

Page No.:

Date ___/___/_____



- **more fragments**:- This bit says if more fragments are following the current fragment.

- **Do not fragment**:- when ever a packet with DF=1, router should not fragment this packet.

- **Re-assembly algorithm**:- used at destination.

  (i) classify the fragments based on the identification number

  (ii) Identify the fragment based on the offset equal to '0' (zero) and designate it as a first fragment.

  (iii) Identify the fragment with MF equal to zero and designate it as a last fragment.

  (iv) Identify the data bytes in the

(3)

DHCP
Boot
RARP

Date __/__/____ Page No.: _____

first fragment and divide it by 8, and search for a fragment with same offset and designate it as a second fragment.

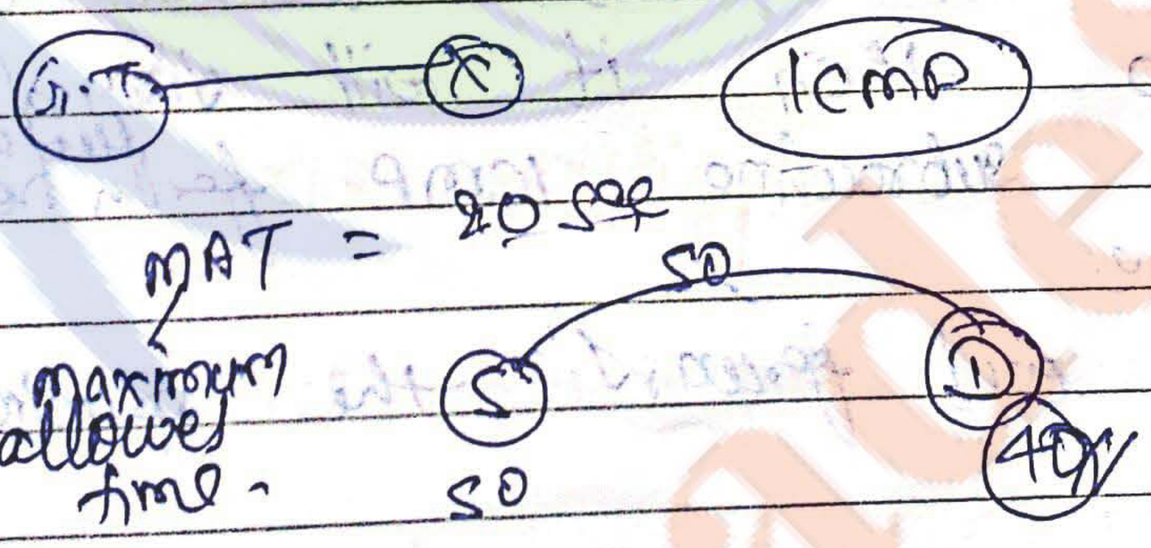
(iv) Divide the databytes of 2nd fragments and result should be added with it's offset value will gives you offset value of next fragment.

(v) Repeat the previous step till completion.

(3) TTL (time to live) :-

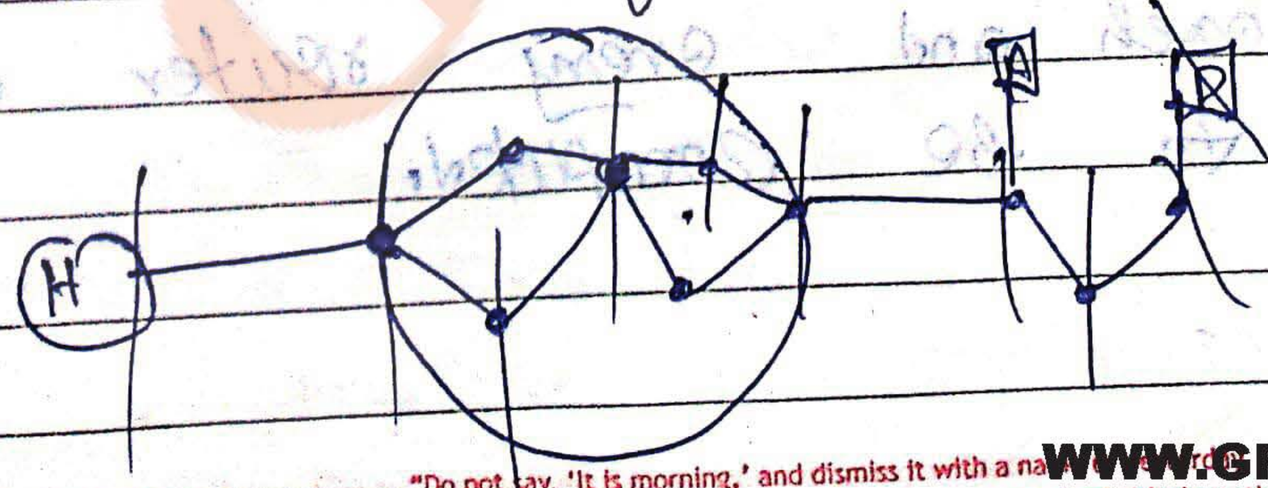
DHCP
Bootp
RARP

Time Stamp :-



Hop Count :-

= Diameter of the network



It is used to avoid infinite looping into the network. This can be implemented in two ways.

(i) Time stamp:- In this approach ~~host~~ will stamp ~~the~~ generation time of the packet and when this packet reach to the router, it will substract it's generation time from it current time and resultant value is compared with the maximum allowed time of the packet. If resultant value is less than maximum allowed time the packet will be forwarded through outgoing link. else the packet will be discarded and ICMP will come into the picture.

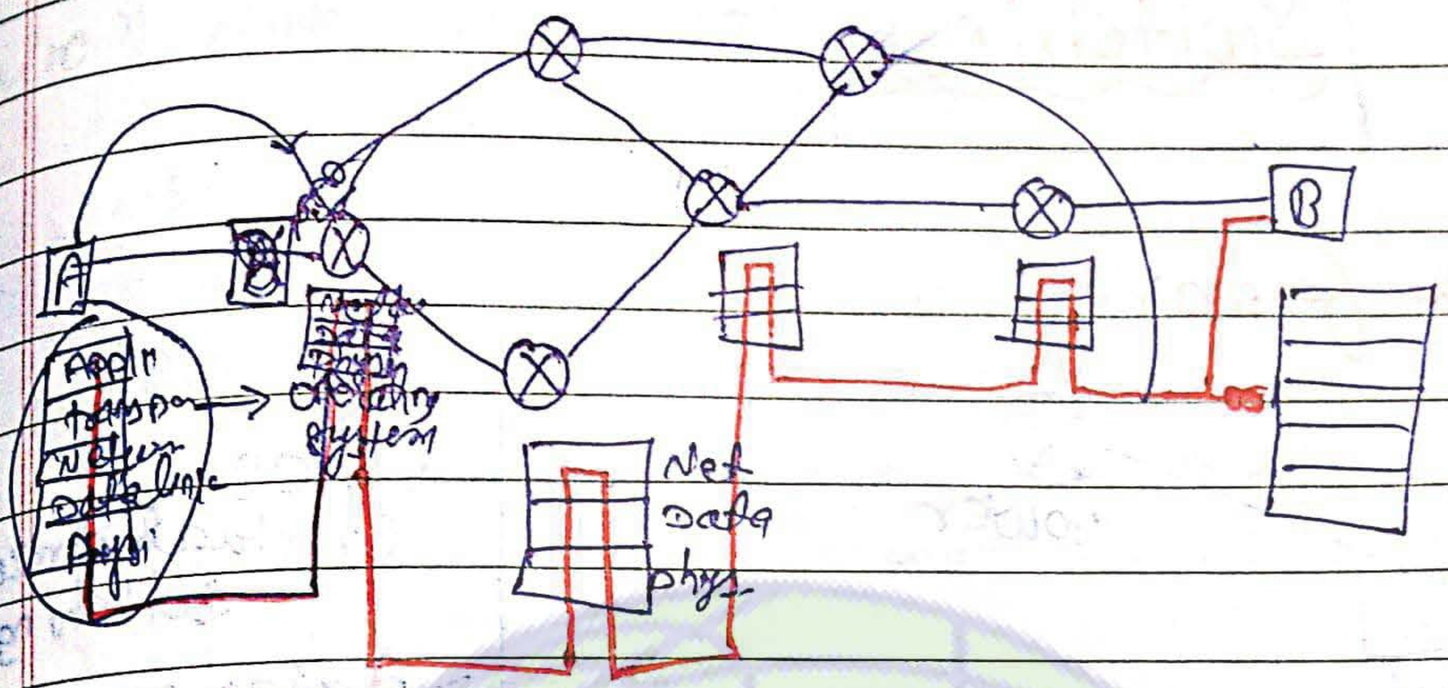
(ii) Hop count:- At host the value of hope count will be initialised by maximum distance b/w source and distination or with the diameter of the network.
when the packet reach at router, router will decrement it's hope count by 1, and check whether hope count value is 0 or less than 0, If so then it will discard the packet and call subroutine ICMP for further necessary action else
It will forward the packet to outgoing link.

(3) Protocol field:-
It is used to identify the service.

(4) checksum:-
At each and every router checksum have to be computed.

Date / /

Page No.:



Network layer = 6

Data link layer = 10

At each and every router checksum have to be Computes because some of the field's in IP header may change as the packet makes a journey towards the destination.

MF, TTL, offset, 16 bit datagram length and option's like

(a) strict source routing :-

(b) loose source routing

(c) time stamp values.

(d) Record route routing

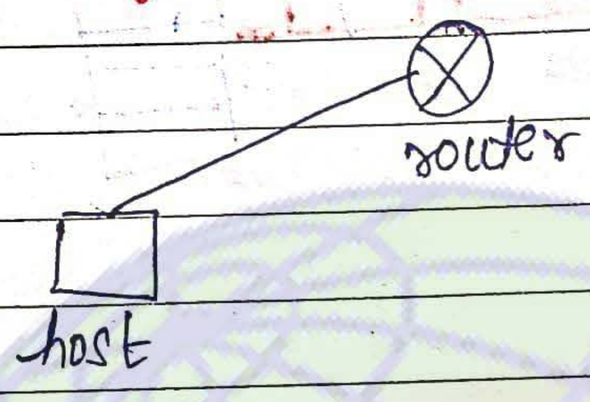
Switching

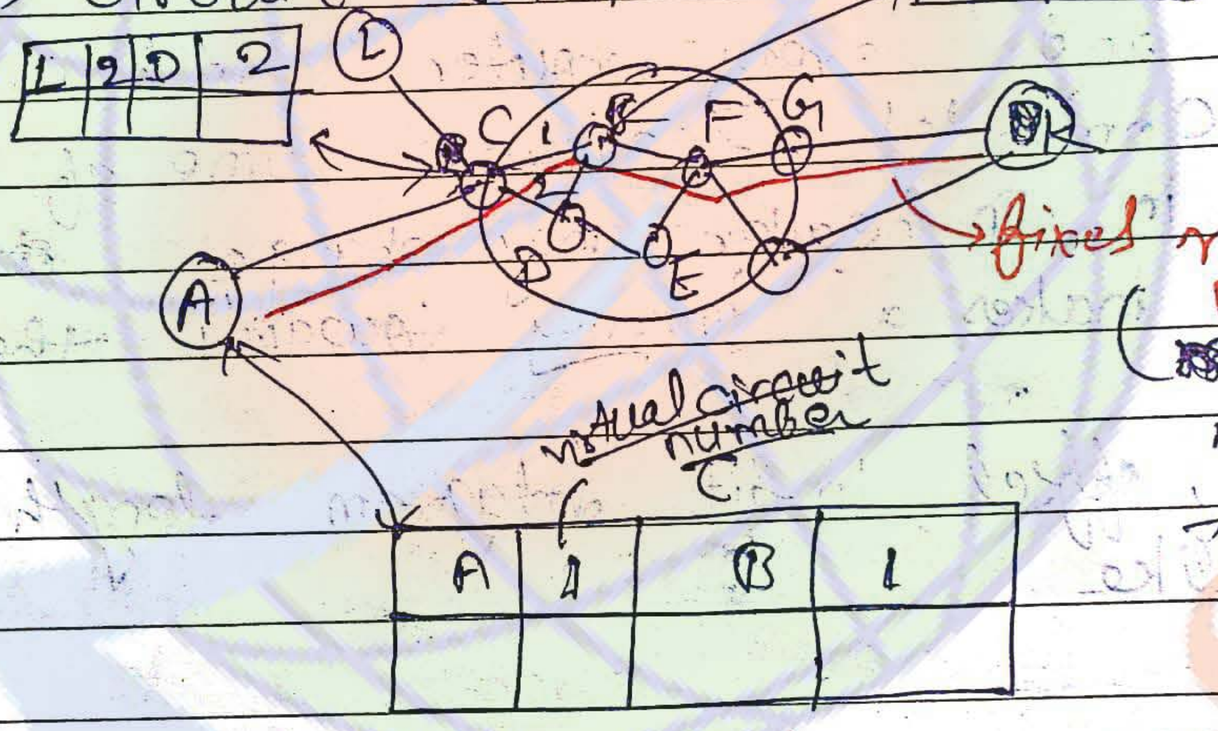
(1) store & forward:-



→ VCS (virtual circuit switching)

→ Datagram switching.

(i) Circuit setup:-



Issues	Datagram	virtual circuit
~~# Datagram~~		
(a) Circuit setup:-	(a) ~~Subnetting~~ not needed	(a) ~~Subnetting~~ required
(b) ~~Stacks~~ information.	each ~~packet~~ contain	
(b) Addressing	each packet contain the full source and destination address	each packet contain a short virtual circuit numb

Date ___/___/___ Page No.: ______

(c) State informati	(c) Router's do not hold state inform about the connection.	(c) each virtual circuit exists for connection.
(d) Routing	each packet is routed independently i.e. complicates loop up procedure	route choosen when virtual circuit is setup & packet will follow it

☆ Routing!

- In datagram each packet routed independently.

i.e. Complicated look up process.

☆ virtual circuit:- Rout choosen when virtual circuit will set

(e) • ~~Affect of router failure~~ ~~Quality of~~ affect of router failure.	• non except for packet loss during the crash.	• All VC's that are passed through the fill router as terminated.

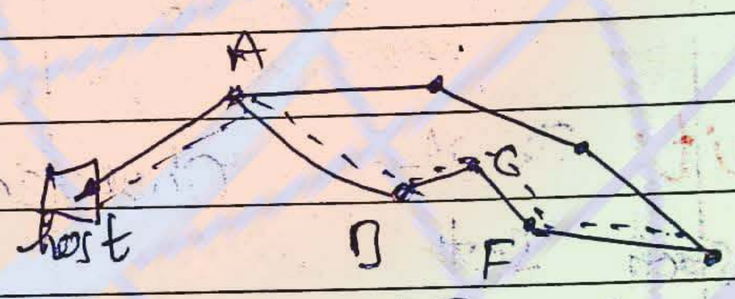
"Do not say, 'It is morning,' and dismiss it with a name of yesterday. See it for the first time as a newborn child that has no name." —Rabindranath Tagore

Date ___/___/_____ Page No.: _____

Quality of services: -	• Difficult	easy if enough resources can be allocated in advance

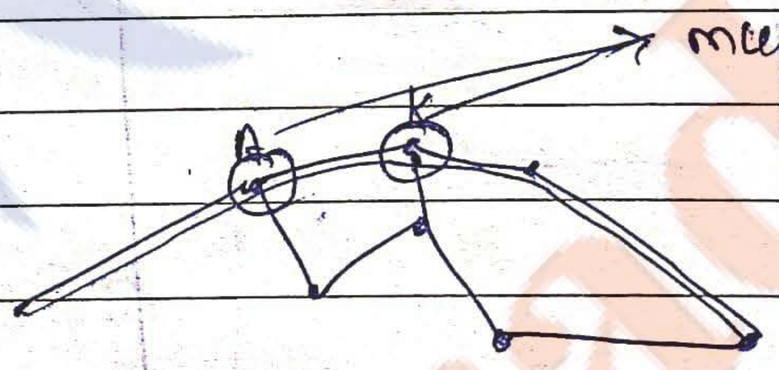
* option fields:-

(i) strict source routing -



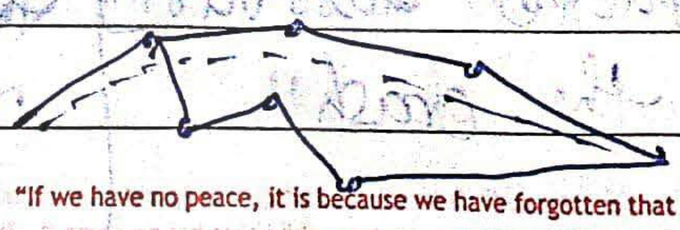
SSR = ABCFG

(ii) loose source routing



(iii) Time stamp values:-

(a) Record route setting -



→ choose which have minimum no. of hops.

(i) Strict source routing :-
In strict source routing packet will be forwarded to the next outgoing link based on route provided by the source.

(ii) loose source routine :-
In loose source routing the path provided by source might not be completed or source can specify some set's of routers that must be includes the path of routing.
So, when this packet reaches at router, router will follow atleast the limited path provides by the source or it will traverse the packet via specified routers.

(iii) Time stamp values :-

Q.7

The network uses a distance vector routing. Once the vect have stablised the distance vector at diff nodes are following. 07

	N_1	N_2	N_3	N_4	N_5
N_1	0	1	7	8	4
N_2	1	0	6	7	3
N_3	7	6	0	2	6
N_4	8	7	2	0	4
N_5	4	3	6	4	0

80/7

50/4

each distance vector is the distance of the best known path at that instance to nodes, N_1 to N_5. where the distance to itself is zero, also all links are symmetric and the cost is identical in both direction. In each round all nodes exchange their distance vector with their respective neighbour's. Then all nodes update their distance vectors in b/w two round any change in the cost of a link will cause the two incident nodes to change only that entry in their distance vector.

The cost of link N_2 to N_3 reduces to 2 in both direction, after the next round

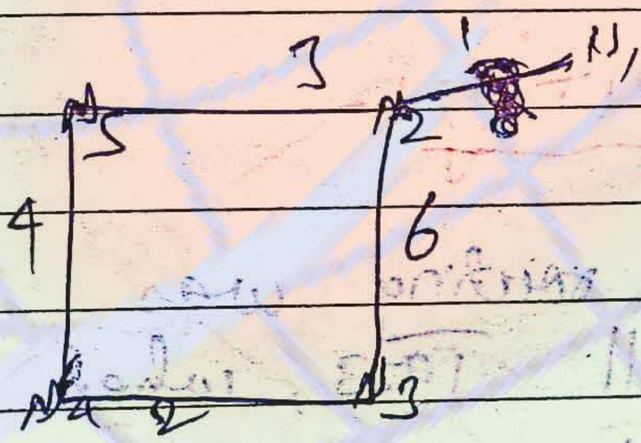
of update, what will be the new distance vector at node N_3.

Sol/

N_3 (3, 2, 0, 2, 5)

Q/ After the updates in the previous question the link N_1 to N_2 goes down, N_2 will reflect this change immediately in it's distance vector as cost "∞", after the next round of update, what will be the cost of N_1 in distance vector N_3.

Sol/



N_1 (0, 1, 7, 8, 4)

N_2 (1, 0, 2, 4, 3)

N_3 (3, 2, 0, 2, 5)

N_4 (5, 4, 7, 2, 0, 4)

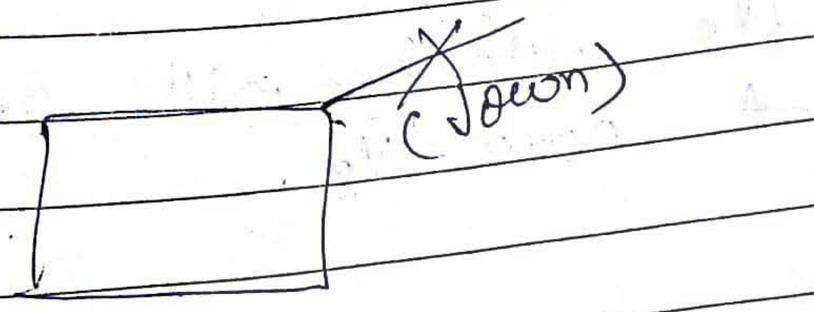
N_1 (0, ∞, 7, 8, 4)

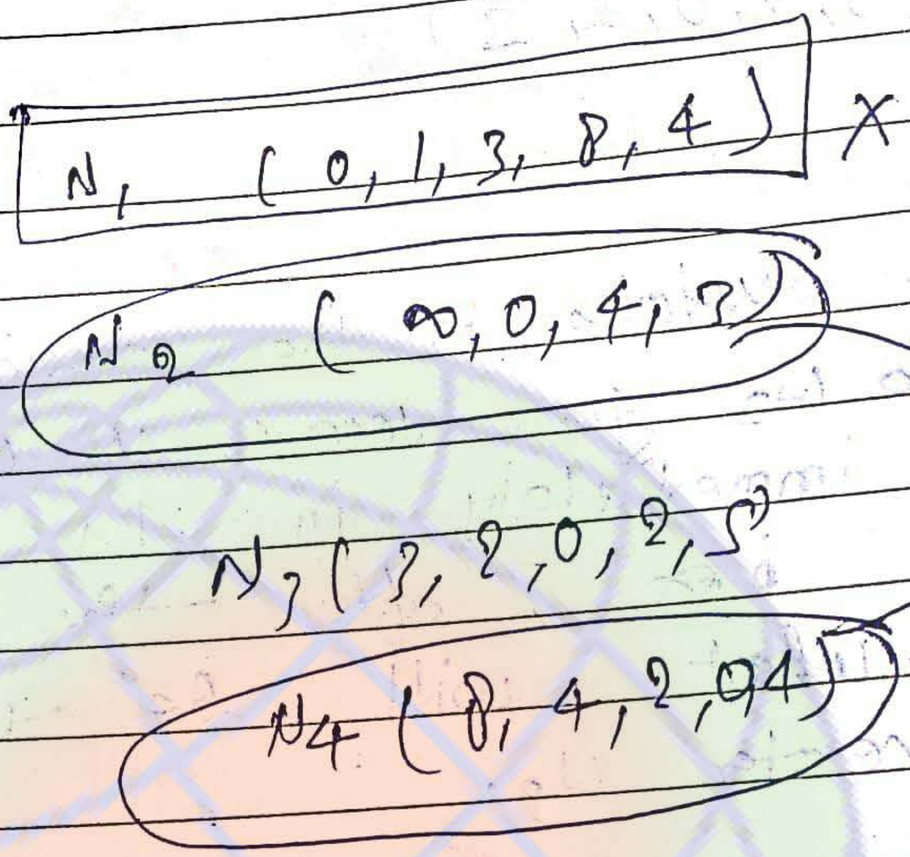
N_1 (0, 1, 7, 8, 4)

N_2 (1, 0, 2, 4, 3)

N_4 (8, 4, 2, 0, 4)

N_5 (4, 3, 5, 4, 0)





✱ Link state routing :-

Distance vector routing was used in ARPANET till 1979, when it was replaces by link state routing.

Two primary problem cause it's demise :-

(a) since the delay matrix was queue length it did not take line bandwidth into account when choosing route.

(b) Count to infinity problem.

- Key the idea behind the link state routing, can be stated as five parts :-

(a) Discover its their neighbour and learn their network address.

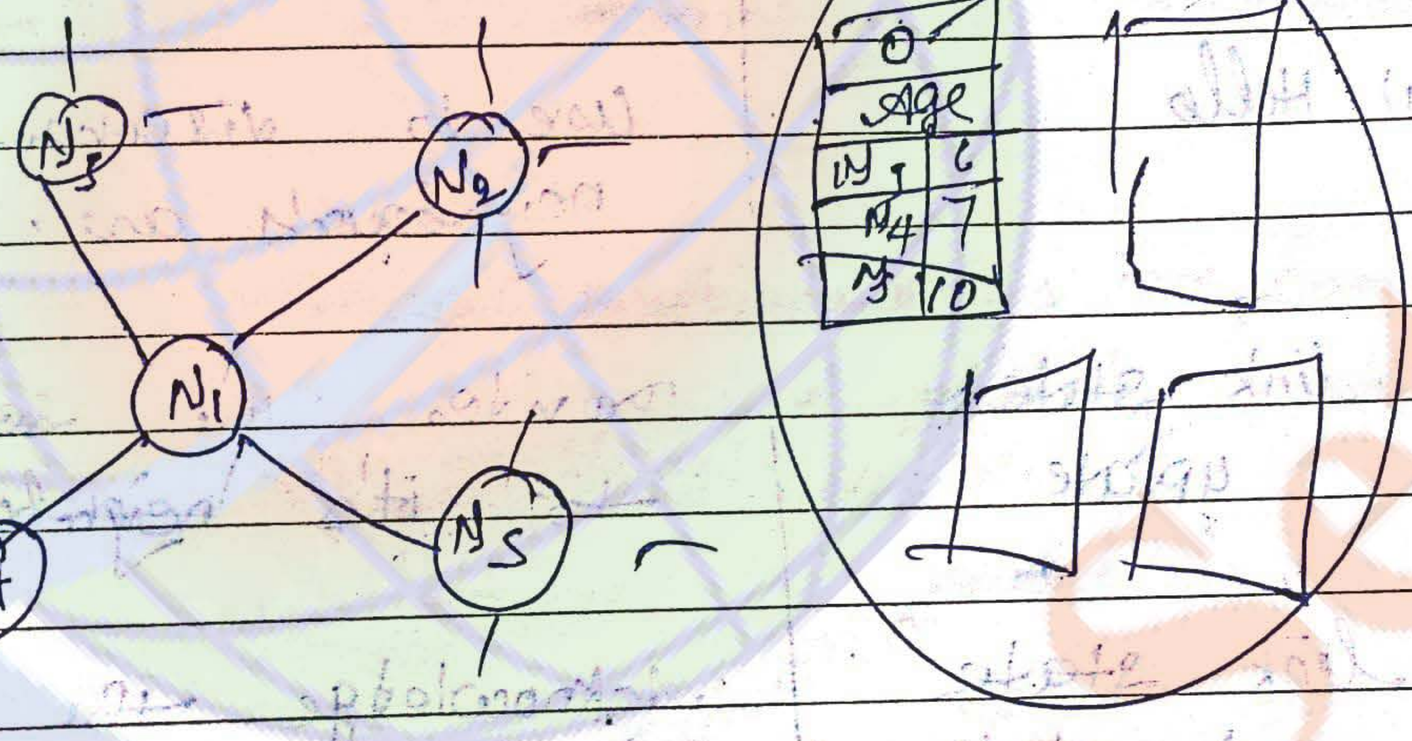
Date ___/___/___ Page No.: _____

(b) Major the delay or cost to each of it's neighbour.

(c) Construct a packet telling all it has just learn

(d) Send this packet to all other routers.

(e) Compute the shortest path to every other router.



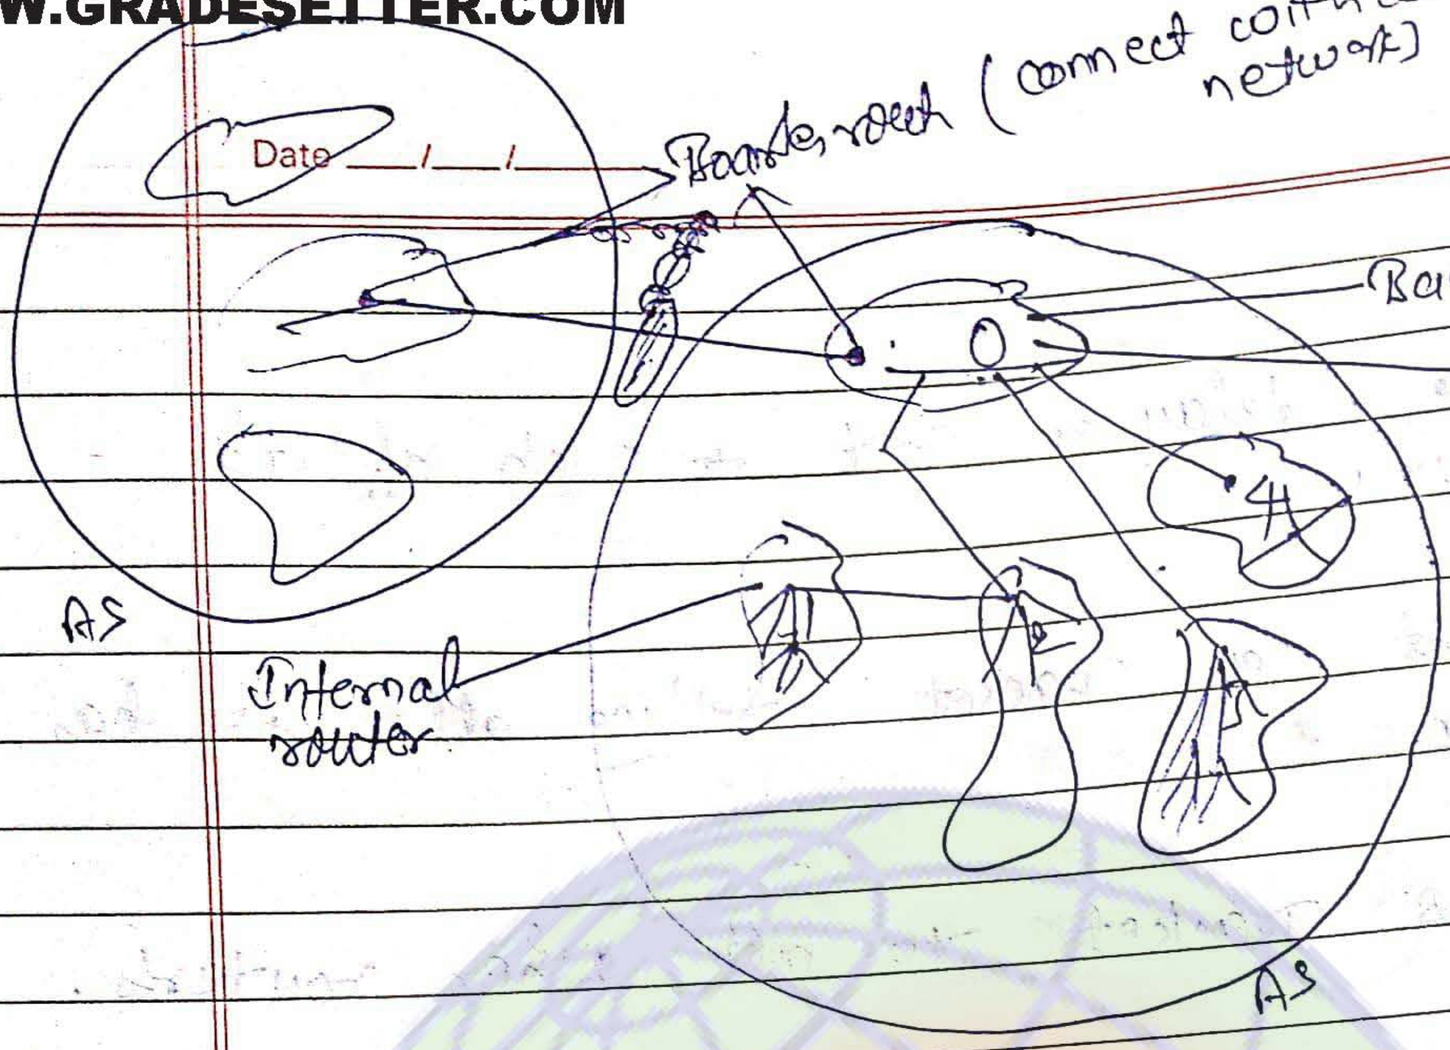
★ OSPF (Open shortest Path first) :-

It's an interior gateway routing protocol.

- Intra - within → OSPF
- Inter - BGP → Border gateway Protocol → exterior

AS - Autonomous system

"Do not say, 'It is morning,' and dismiss it with a name of yesterday. See it for the first time as a newborn child that has no name." —Rabindranath Tagore



message type:-	Description :-
(a) Hello	use to discover who the neighbour's are.
(b) link state update	provides the sender cost to it's neighbour.
(c) link state acknowledgement	Acknowledge the link state update.

In 1988, the internet engineering task force begin work on sucessor of orginal Internet a interior gateway protocol which was a distance vector protocol based on balman ford algorithm.
The sucessor called OSPF, became standard in 1990. OSPF support three kind of connection in network :-
(a) Point to Point lines b/w exactly two routers

Date ___/___/_____ Page No.: _____

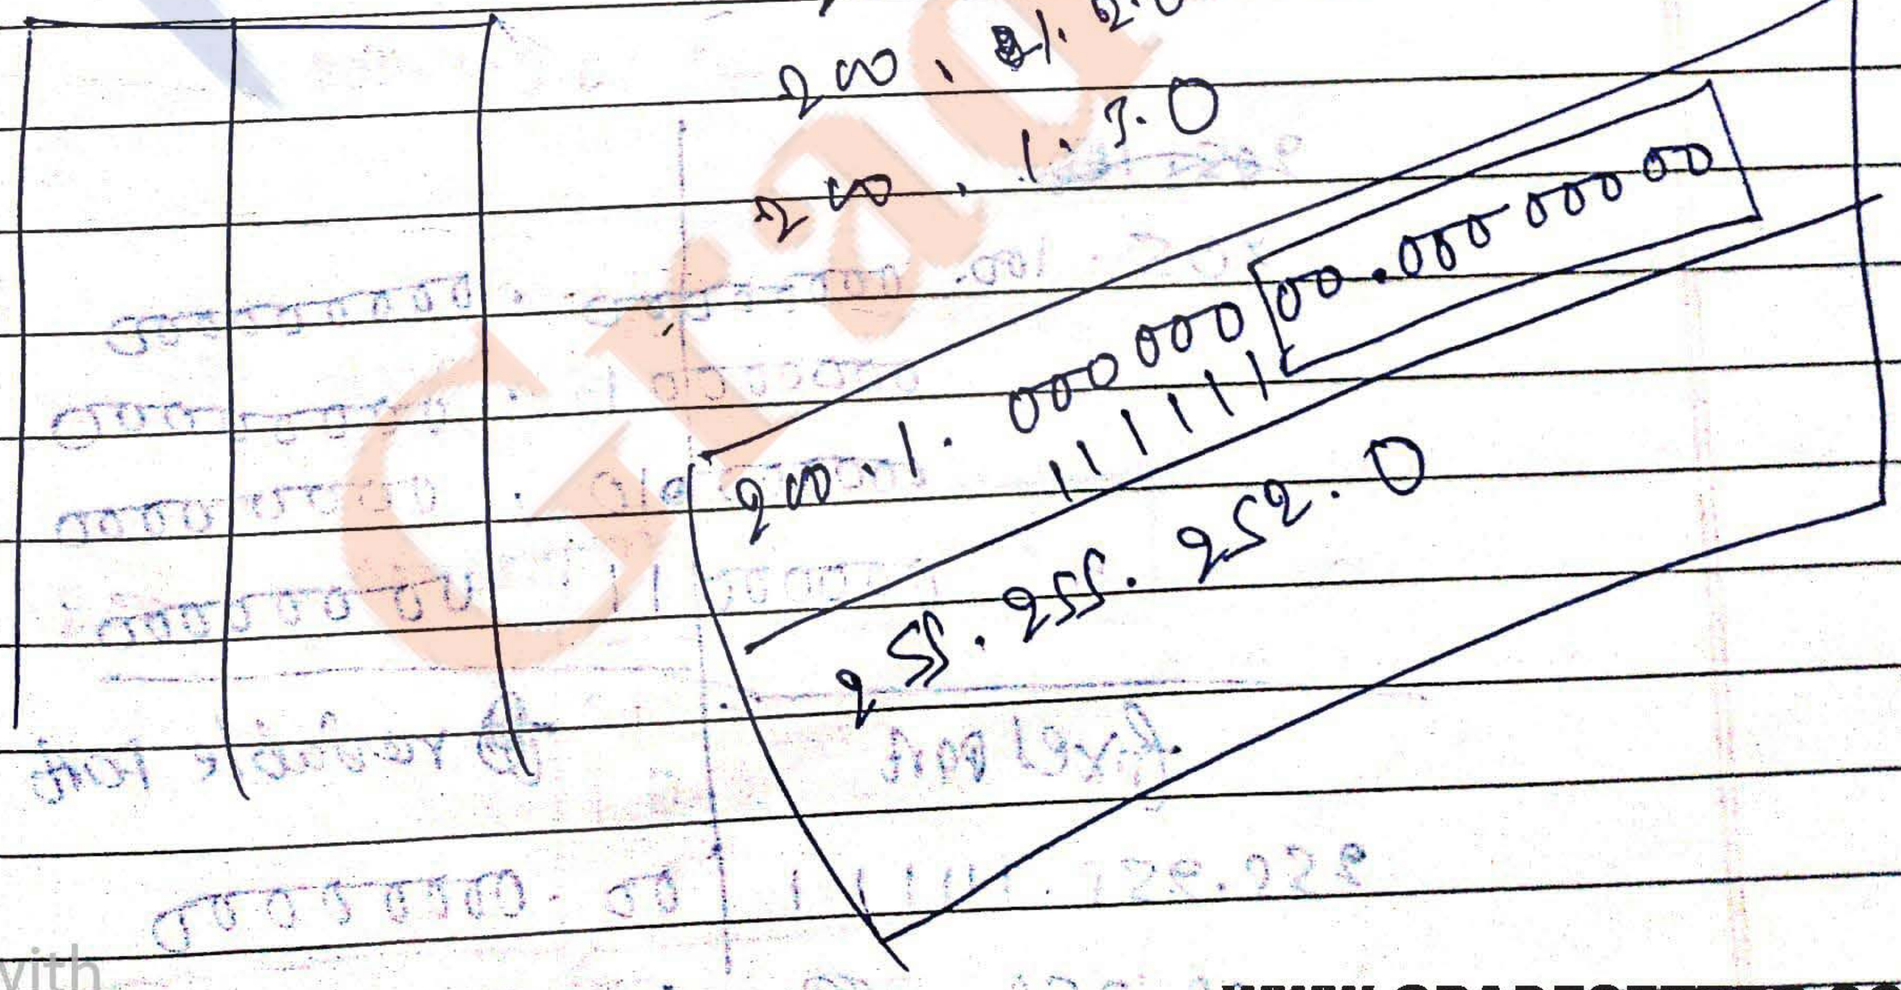
(b) multi access networks with broadcasting
(c) multiaccess networks without broadcasting

A multiaccess network is one that can have multiple routers on it and each of which can directly communicate with all others.

☆ Super-netting :- (Useful)

The process of aggregating two or more networks to generate a single network is supernetting.

Restriction in supernetting :-
(i) All the network must belongs to same class.
(ii) The network id of the network must be in sequential order or contigious.
(iii)



Date ___/___/_____ Page No.: _____

Subnet mask :

It is uses to generate single IP address to a group of network based on two rules :-

(i) The no. of 1's indicate fixed part.
(ii) No. of 0's indicate variable part.

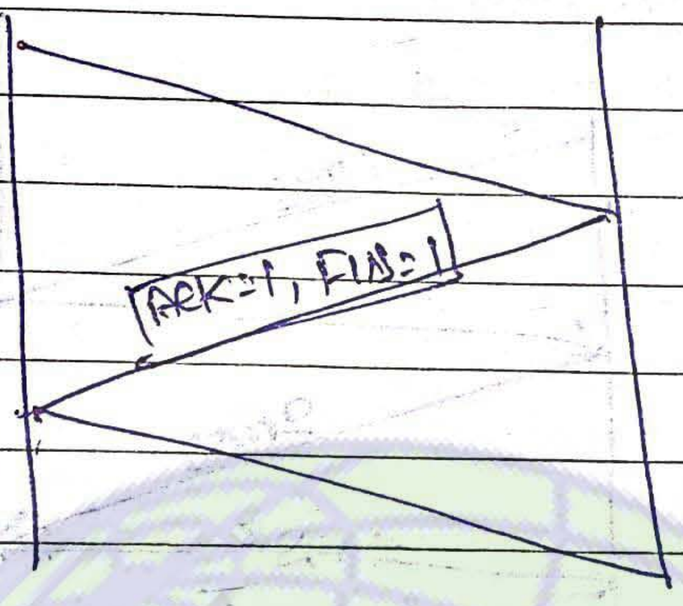
3 way handshaking



TCP Congestion Control-

TCP sender is having two windows one is sender windows (ws) and 2nd is congestion window (wc). ws will give you receiver capacity and wc will give you underline network capacity.

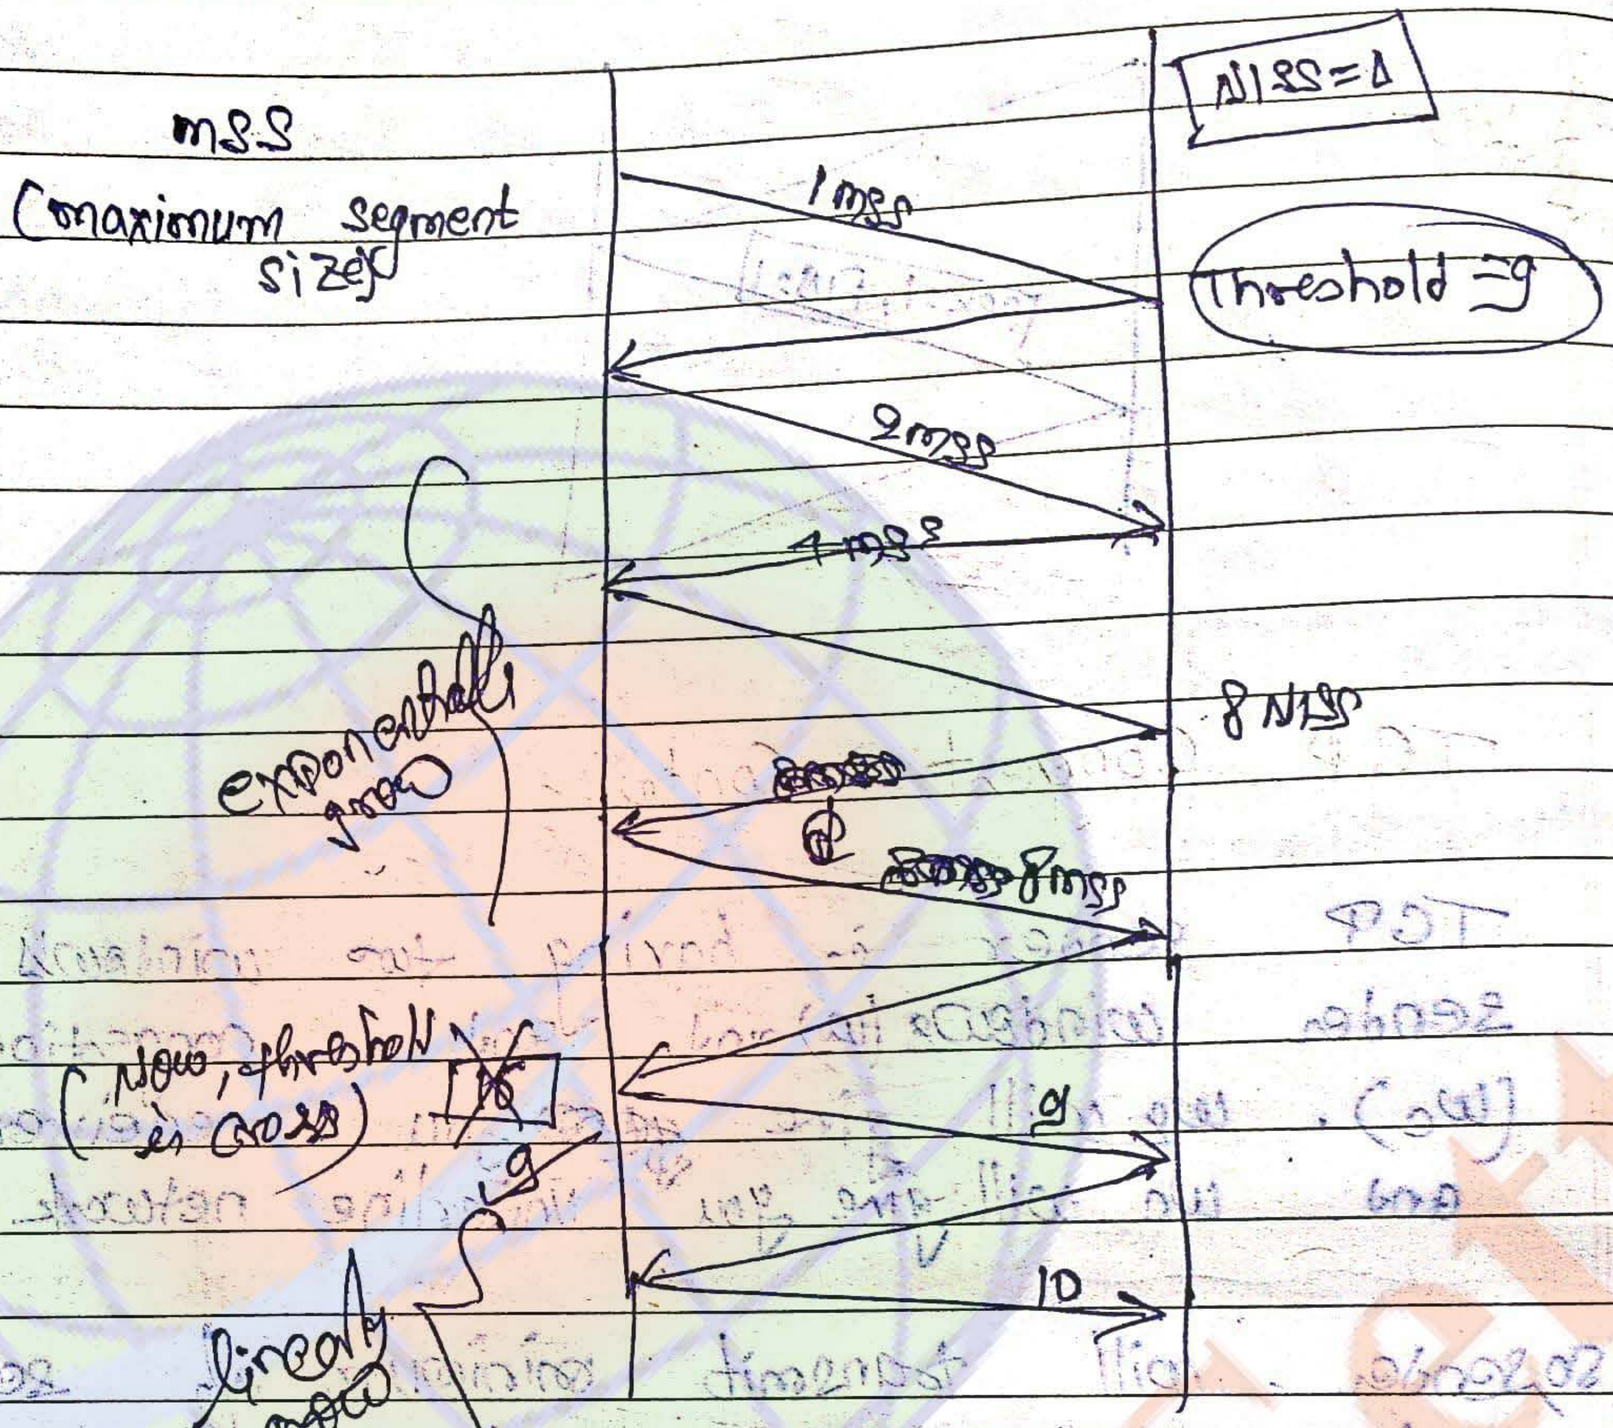
so sender will transmit minimum of sender window and congestion window.

- Estimation of sender window size:-
  It can not be statically determined so, we use advertisment windows dynamically.

- Estimation of Congestion window size.
  There is no static method which means we have to go for AIMD algorithm.
  ↳ Additive increase and multiplicative decrease.

Date __/__/____ Page No.: ____

✱ Slow start Phase:-



✱ How does sender perceive Congestion?

(i) loss event:- Time out or 3 duplicate acknowledgement.

(ii) Sender's limit transmission = last byte sent - last byte ack

should be less than equal to congestion window.

$T_p = \frac{\min(w_c, w_s)}{R+T}$ = rate at transmitte the data.

Date __/__/____

Page No.: _____

- After 3-duplicate acknowledgement the congestion window cut in half and window then grow linearly.

But after time out event congestion window set to 1mss (maximum segment size), window then grows exponentially to a threshold, then grows linearly.

→ 3 duplicate ack. indicates network capable of delivering some segments. but timeouts indicates a more alarming congestion scenario.

* Congestion avoidance: -

* 3-duplicate packet: -

* Time-out: -

a) Consider an instance of TCP AIMD algorithm where window size at the start of slow start phase is 2mss and the threshold at the start of first transmission is 8mss. Assume that a time out occurs during 5th transmission. find the congestion window size at the end of 10th transmission.

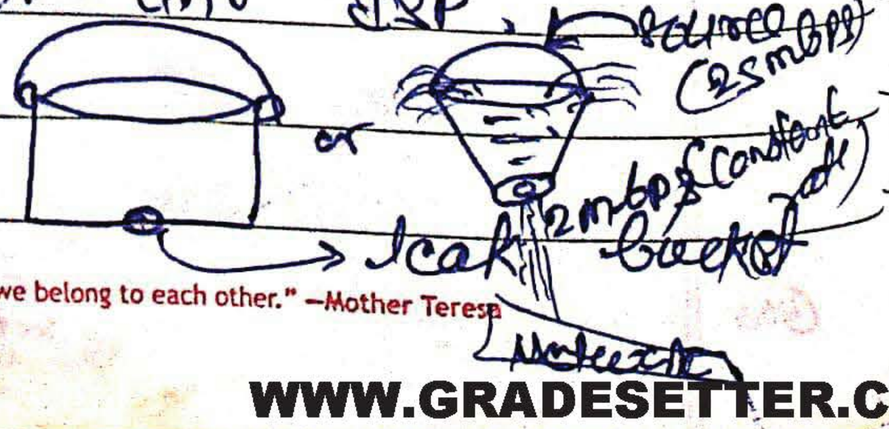
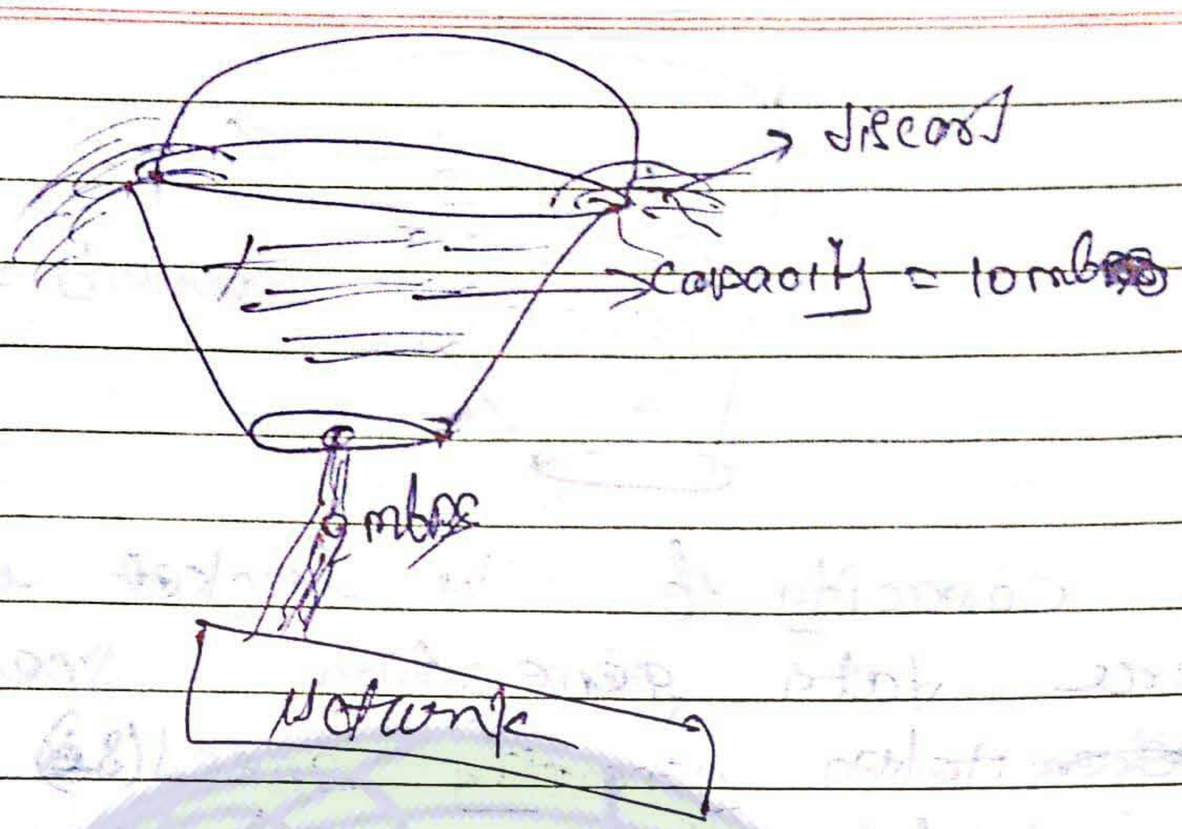
Quality of Service! -

1.) Traffic shaping! - There should be agreement b/w user and ISP.

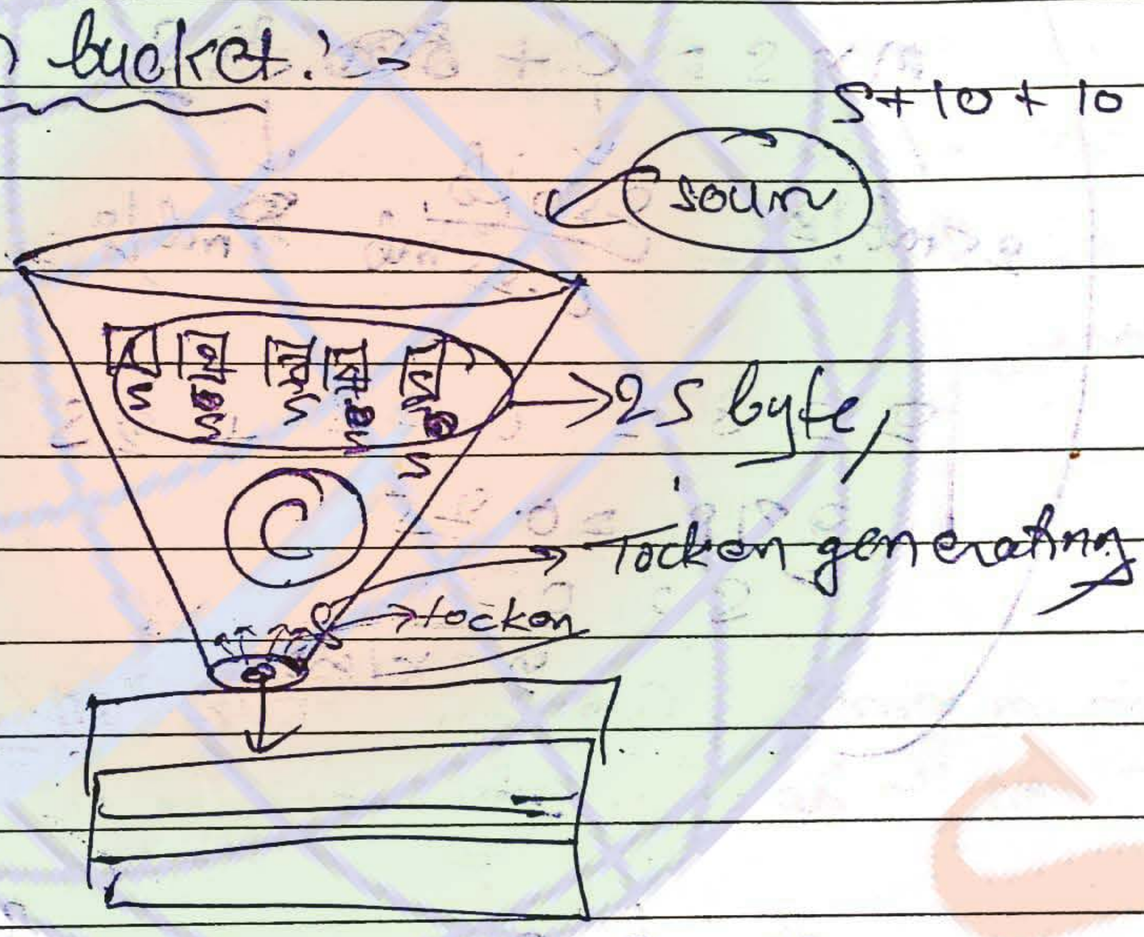
↳ leaky bucket! -



"If we have no peace, it is because we have forgotten that we belong to each other." —Mother Teresa



↳ Token bucket:-



M → rate at which the source is generating the data

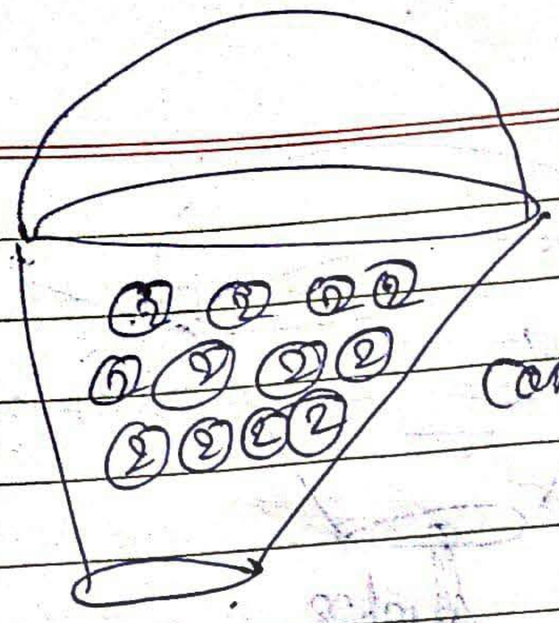
S → is the burst time. / Total time that the sance will transmite the data,

C → capacity of bucket

$m \times S = C + \rho \times S$

ρ → Token generating speed.

Date ___/___/_____ Page No.: _____



capacity = 40mbite

eg.) If capacity of the bucket is ~~200kb~~ 250kb source data generation speed is 25 mb/s. ~~token~~ token generating speed(s) is 2mb/s calculate the s.

Soln

$$m \times s = C + f \times s$$

25mb/s, 250kb = 0.25mb, 2mb/s

$$25s = 0.25 + 2s$$

$$23s = 0.25$$

$$s = \frac{0.25}{25 \times 10^6}$$

$$25 \times 10^6 \times s = 250 \times 10^3 + 2 \times 10^6 \times s$$

$$\left(25 \times 10^6 - 2 \times 10^6\right) = 250 \times 10^3$$

$$23 \times 10^6 \times s = 250 \times 10^3$$

$$s = \frac{200 \times 10^3}{23}$$

$$= 10.9 \text{ msec}$$

Date __/__/____ Page No.: _____

TCP Timer management:-

Timer for it's operation :-
(i) Acknowledgement timer:-
(ii) Keep alive timer's
(iii) Persistance timers
(iv) Timed and wait timers.

(ii) Keep alive timers:-

It is used to keep track of ideal TCP connections. If there is no communication for a Pre-defined period of time, the connection will be closed automatically.
eg. netbanking time

(iii) Persistance timers:-

It is used in silli window syndrom to transfer silli packets in equal interval of time. This decided by Percistance timer's.
eg. ATM regularly sends the packet.

(i) Acknowledgement timer:-

We Cant determine round trip time statically as we did in data link layer. So we need dynamic methods.

A Basic algorithm:-

Let's assume initial round trip time (IRTT) is equal to 50 sec. Smoothing factor is equal to 0.9 ($0 < \alpha < 1$)

"Do not say, 'It is morning,' and dismiss it with a name of yesterday.
See it for the first time as a newborn child that has no name." —Rabindranath Tagore

Date __/__/____ Page No.: ____

new round trip time (NRTT) is equal to 70sec.
find the estimated roundtrip time.

Estimated round trip time (ERTT) = $\alpha \times$ ERTT $+ (1-\alpha)$ NRTT

So [NRTT = 50sec
smoothing factor > 0.9 ($0 < \alpha < 1$)
NRTT = 70sec

ERTT $= 0.9 \times 50 + (1-0.9) \times 70$
$= 52$ sec

Time out $= 52 \times 2$
$= 104$ sec

Now, assume:-
New round trip time = 80 sec
then ERTT = ? → Now this estimate become initial,

ERTT $= 0.9 \times 52 + (1-0.9)\ 80$
$= 54 \times 8$

Time out $= 54 \times 8 \times 2$
$= 1096$

Note:- The default time out of basic algorithm is twice of estimated round trip time.

Linux Tunnel → through access, Proxy server, VPN - Configure

Date __/__/____ Page No.:

* Jacobson's Algo!-

This algo says that instead of multiplying roundtrip time with 2, you can take standard deviation to calculate the time out.

$$SD = |DRTT - NRTT|$$

SD → Standard deviation

Q) If IRTT = 50 sec, and NRTT = 70 sec, Find SD = ?, $\alpha = 0.9$, let D_i = initial deviation = 5 sec

Sol:

$$ERTT = 0.9 \times 50 + (1 - 0.9) \times 70$$
$$= 52 \text{ sec}$$

$$D_N = SD = |50 - 70|$$
$$= 20 \text{ milliseconds}$$

D_N ← New deviation.

$$D_E = \alpha \times D_i + (1 - \alpha) D_N$$
$$= 0.9 \times 5 + (1 - 0.9) 20$$

D_E → estimated deviation

estimated deviation = 4.5 + 2
= 7.5

$$T_O = ERTT + 4 \times D_E$$

T_O → Time out

D_E → Estimated deviation

$$= 52 + 4 \times 7.5$$
$$= 52 + 30.0$$
$$= 82$$

"Do not say, 'It is morning,' and dismiss it with a name of yesterday. See it for the first time as a newborn child that has no name." —Rabindranath Tagore

Date ___/___/_____ Page No.:

KARN'S Algorithm

If time out occurs because of delayed acknowledgement, the data packet is re-transmitted. Then there is a possibility of two acknowledgements -

(i) The delayed acknow. of 1st packet
(ii) Acknowledgement for retransmitted packet

Then it causes ambiguity that which ack. must be taken into consideration for the next transmission. So, this ambiguity is resolve by karn's algo which says that.

Don't update the roundtrip time for any segment which is re-transmitted but just double the amount for each failure until segments get through

UDP

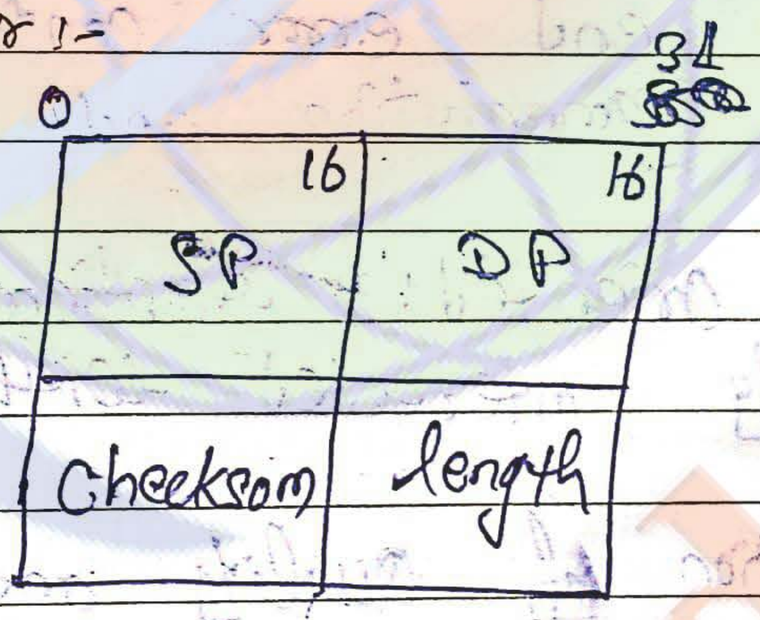
(i) It is connection less protocol. It is used for multicasting and broadcasting application

(ii) for real time application, TCP is not applicable because of congestion window - that why UDP is used, It does not have congestion window.

(iii) For multimedia application TCP is not used because of congestion window.

(iv) Some application requires fastness rather than reliability. so TCP can't be used.
eg. DNS,

★ UDP header :-



★ The difference b/w UDP and TCP

TCP	UDP
(i) Connection oriented, reliable, slow	(i) connection less, non-reliable and fast
(ii) overhead is high due to header and connection	(ii) overhead is low

"Do not say, 'It is morning,' and dismiss it with a name of yesterday.
See it for the first time as a newborn child that has no name." —Rabindranath Tagore

Date ___/___/_____ Page No.

(iii) HTTPS, FTP, Telnet, remote login, SMTP, these all are using the application of TCP.

(iv) Web application, mail file transfe, remote system administration they all uses TCP

(iii) DNS, SNMP (Simple network management protocol), RIP, all multimedia Protocols uses UDP.

(iv) name translation, real time, multi broad casting, multicasting and network management. These all done by UDP.

* Responsibility of transport layer Protocol:-

(i) End to end error control, flow control, and segmentation and re-assembly.

(ii) User Oriented:- Application Programmer can directly interected with ∞

(iii) Negotiation of quality and type of service

(iv) It also deals with storage capacity of the subnet and congestion control.

* (v) multiplexing and demultiplexing

(vi) Service port addressing or Socket addressing.

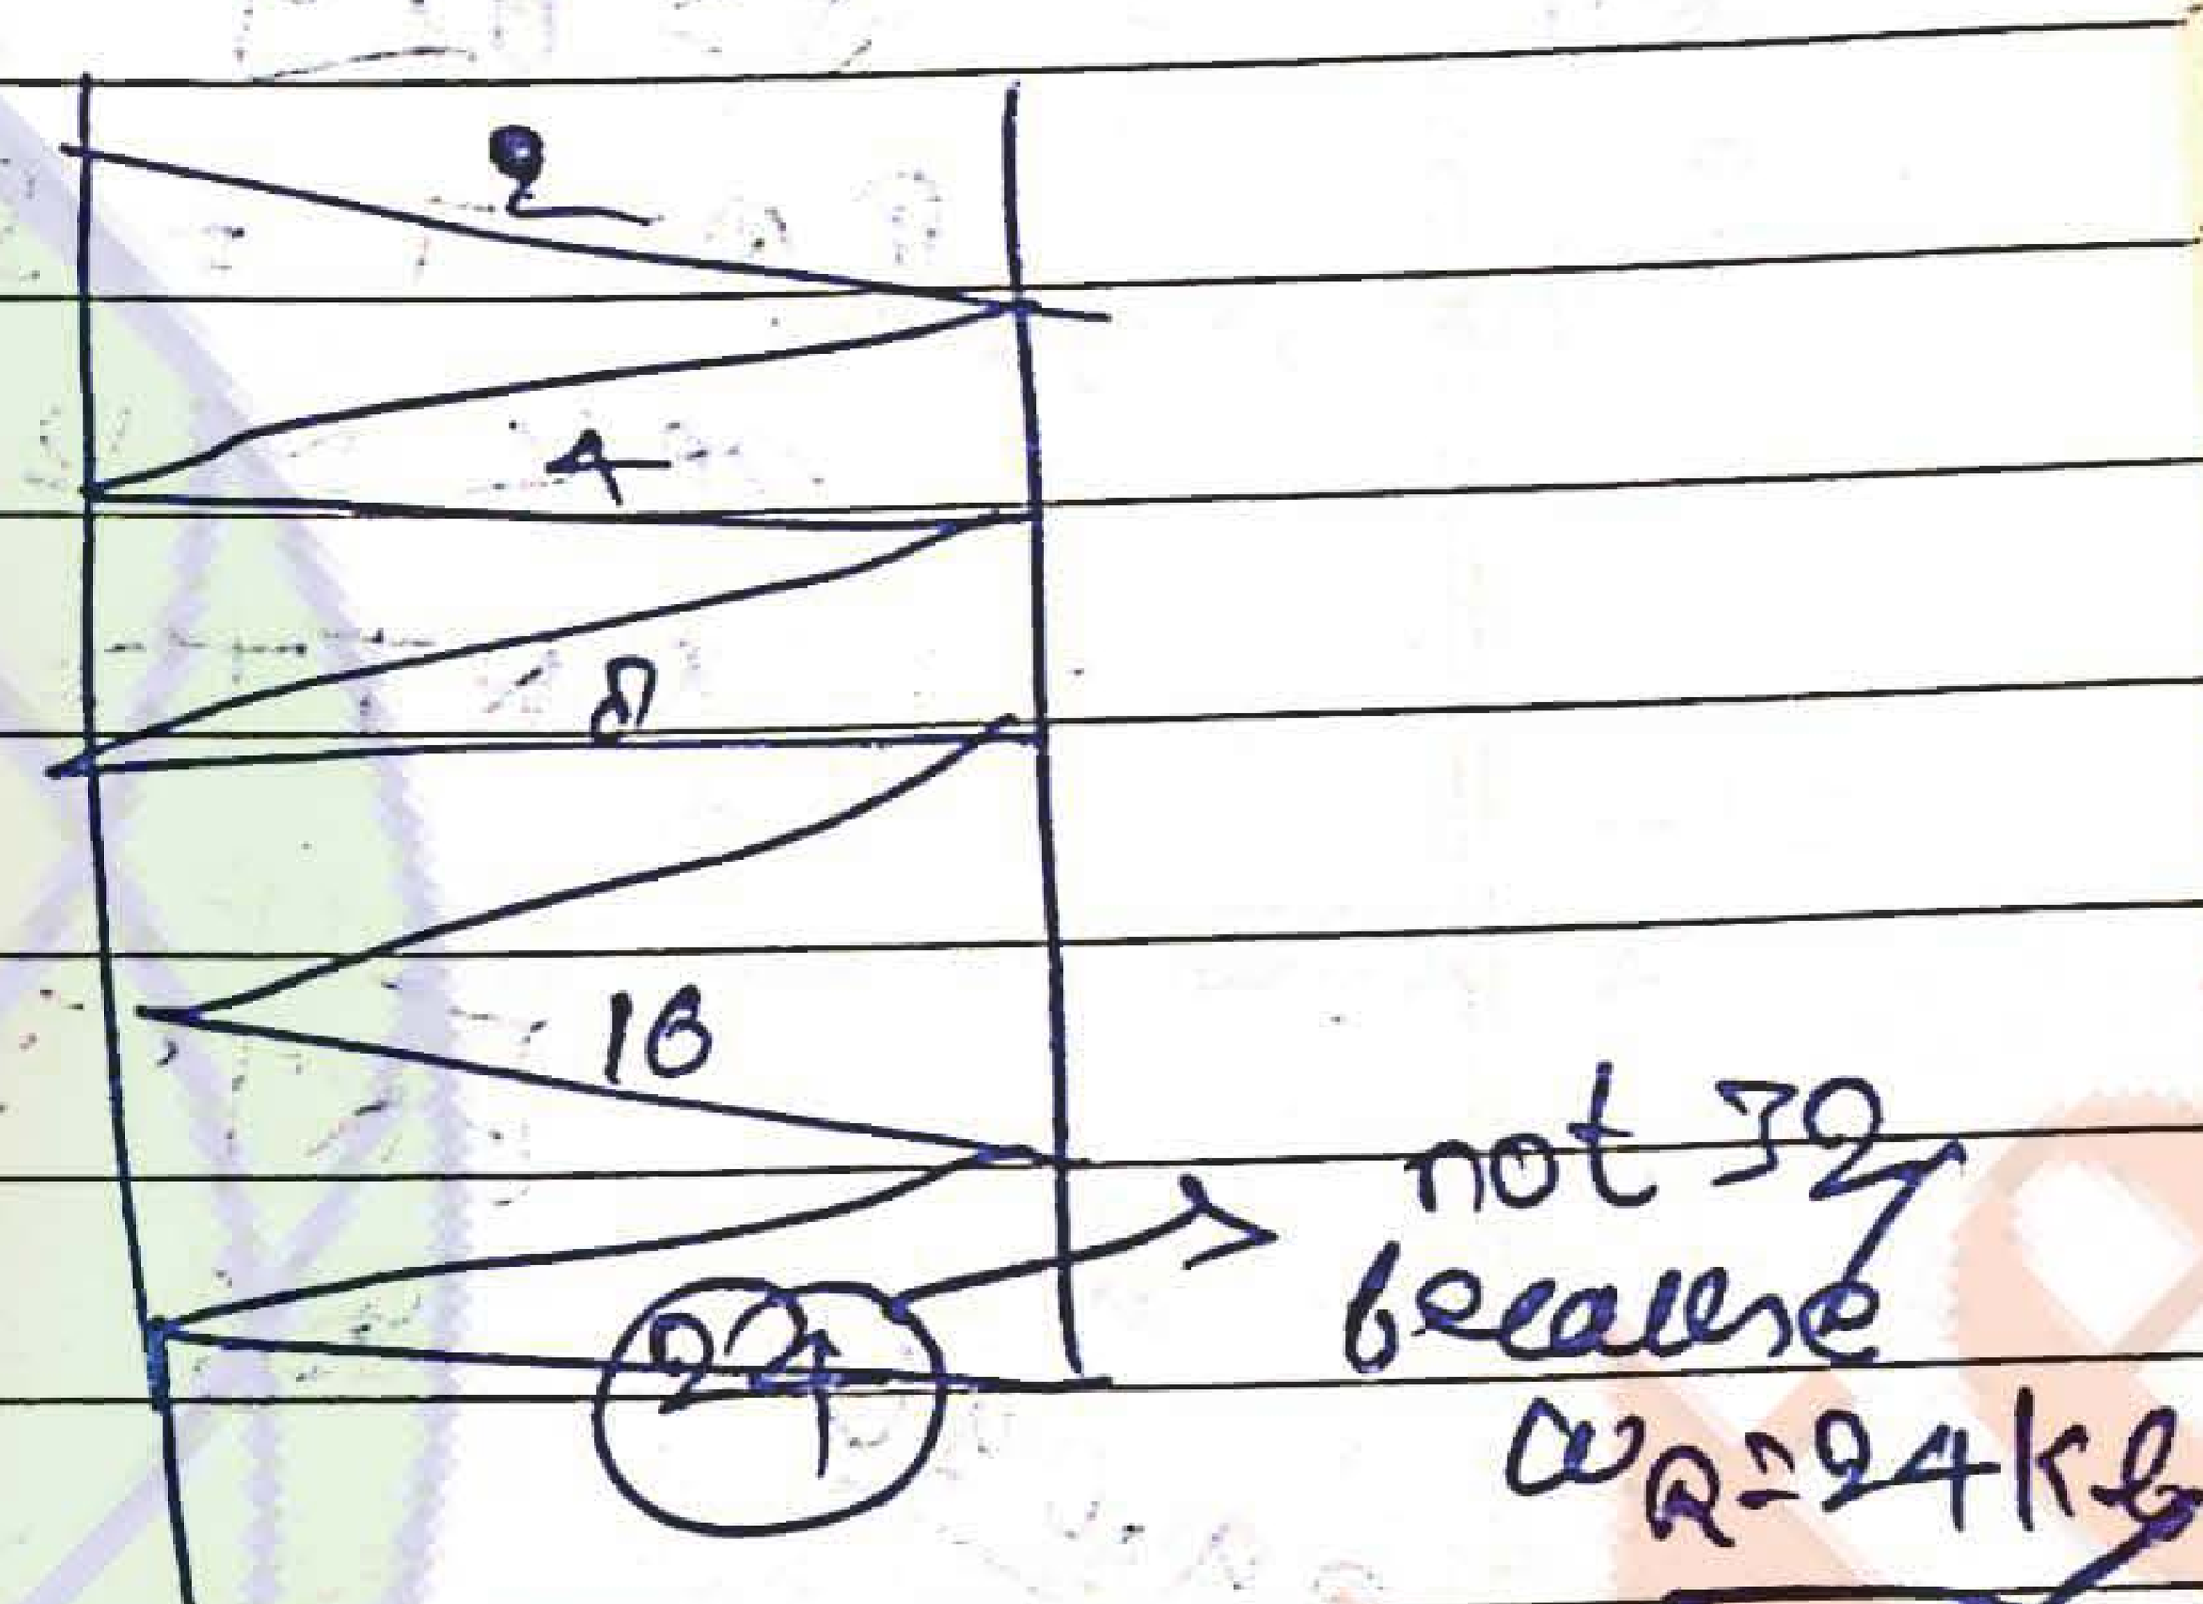
Q. ~~SPDTPOST~~

Q) Consider the affect of slow start on a line with 10 milisecond RTT, and no congestion the receiver windows size is 24 kb and maximum segment size is 2kb. how long does it take before the 1st full window can be sent.

So/- RTT = 10 milisecond

w_R = 24 kb

max. seg size = 2 kb



Q) suppose the TCP congestion window is 18 kb, and then time out occur's. then how big will be the congestion window, of the next 4 transmission's burst. assume that the maximum segment size is 1 kb.

So/- Congestion window size = 18

Now, time out

So, threshold = $\frac{18}{2}$ = 9

Date ___/___/_____ Page No.:

Q) If the TCP roundtrip time is currently 30 milisec, and the following ack. comes in after 26, 32, 24 milisec. What is the new roundtrip time estimated.

Using Smoothing factor is 0.9

$\delta = 0.9$

$RTT = 30$ milisec

ack = 26, 32, 24 milisec.

$NRTT = ?$

$ERTT = \alpha \times RTT + (1-\alpha) NRTT$

$= 0.9 \times 30 + (1-0.9) NRTT$

$= 26.0 + 0.1 \times 26$

$= 29.6$

$ERTT = 0.9 \times 29.6 + 1 \times 32$

$= 29.84$

$ERTT = 0.9 \times 29.84 + 1 \times 24$

=

Q) A TCP machine sending windows of 65535 bytes. over a 1 Gbps channel that has 1 way delay of 10 milisecond what is the maximum throughput achivable

and what is efficiency.

Sol'n

$W_s = 65535$ bytes

Throughput $= \frac{L}{RTT}$ — L = length of block, RTT = Round trip time

$= \frac{2^{16} \times 10^3}{20 \times 10^{-3}} = \frac{2^{16} \times 100}{10^{-2}} = 50 \times 2^{16}$

Throughput $= 50 \times 2^{16}$

$= 50 \times 2^{10} \times 2^6$

$= 50 \times 64 \times 10^7$

$=$

Efficiency $= \frac{\text{Throughput}}{\text{Bandwidth}} = \frac{50 \times 2^{16}}{2^{30}} = 50 \times 2^{-14}$

Q) The packet source can which of the following functionality must be implemented by transport layer protocol over and above the network layer protocol.

(a) recovery from pack loss
(b) detection of duplicate packets
(c) Packet delay in
(d) end-to-end connectivity.

Q) ~~which of the following~~ The routing table of a router is given below

Destination	Subnet mask	Interface
128.75.43.0	255.255.255.0	ethernet zero
128.75.43.0	255.255.255.128	ethernet one
192.12.75.5	255.255.255.125	ethernet 2
Default	0.0.0.0	ethernet 3

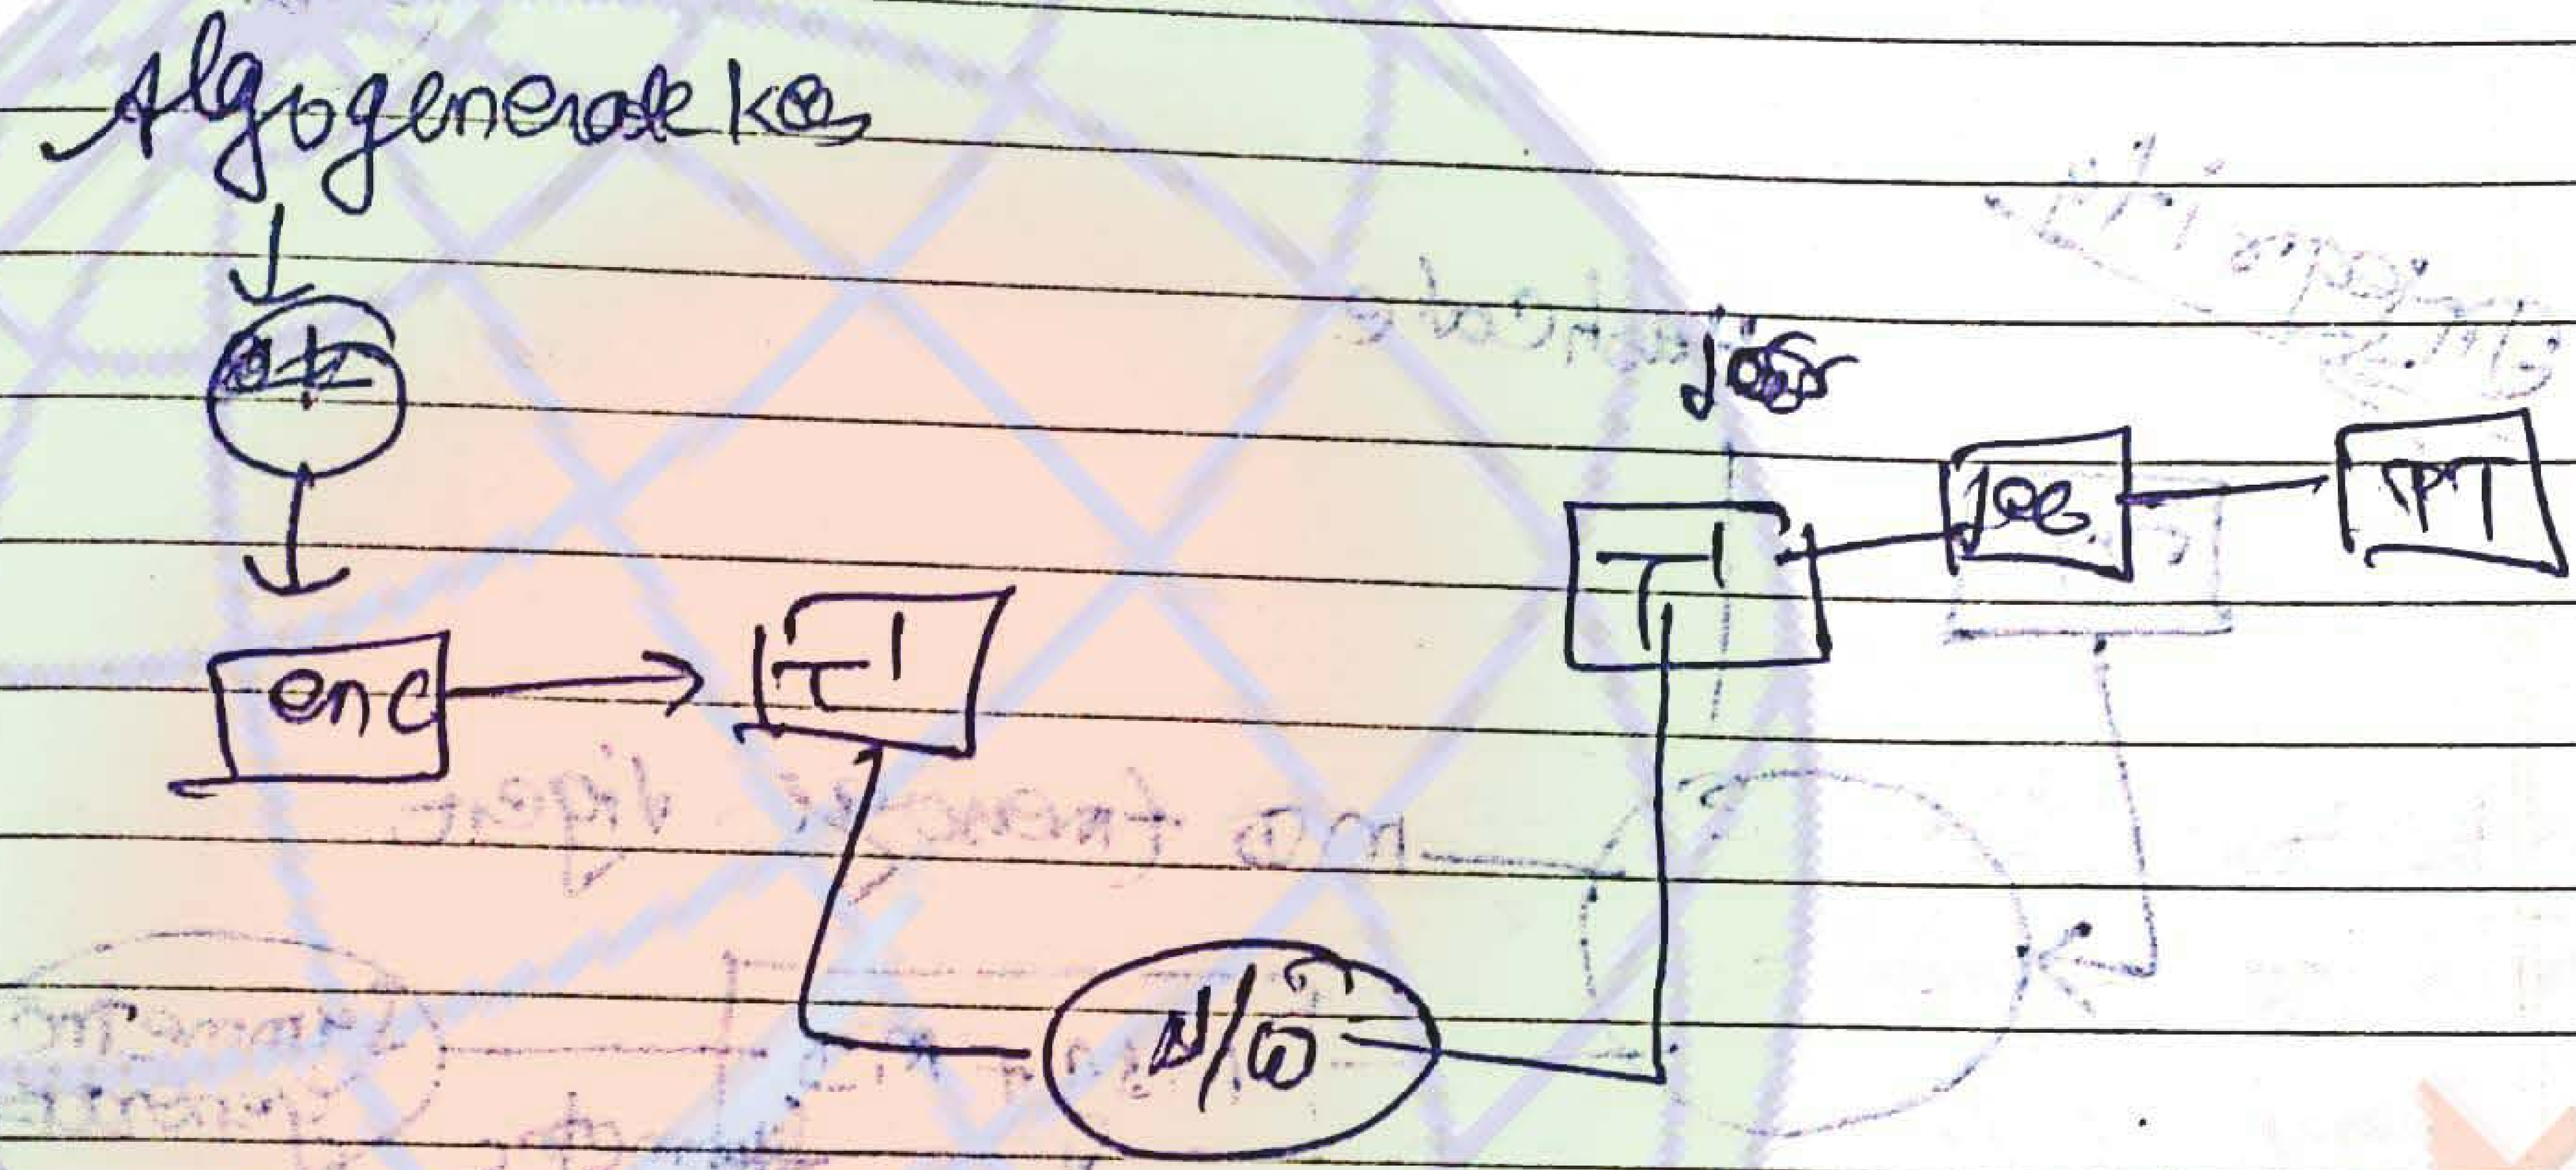
4.) Diffbi algorithms –

(5) Symmetre –

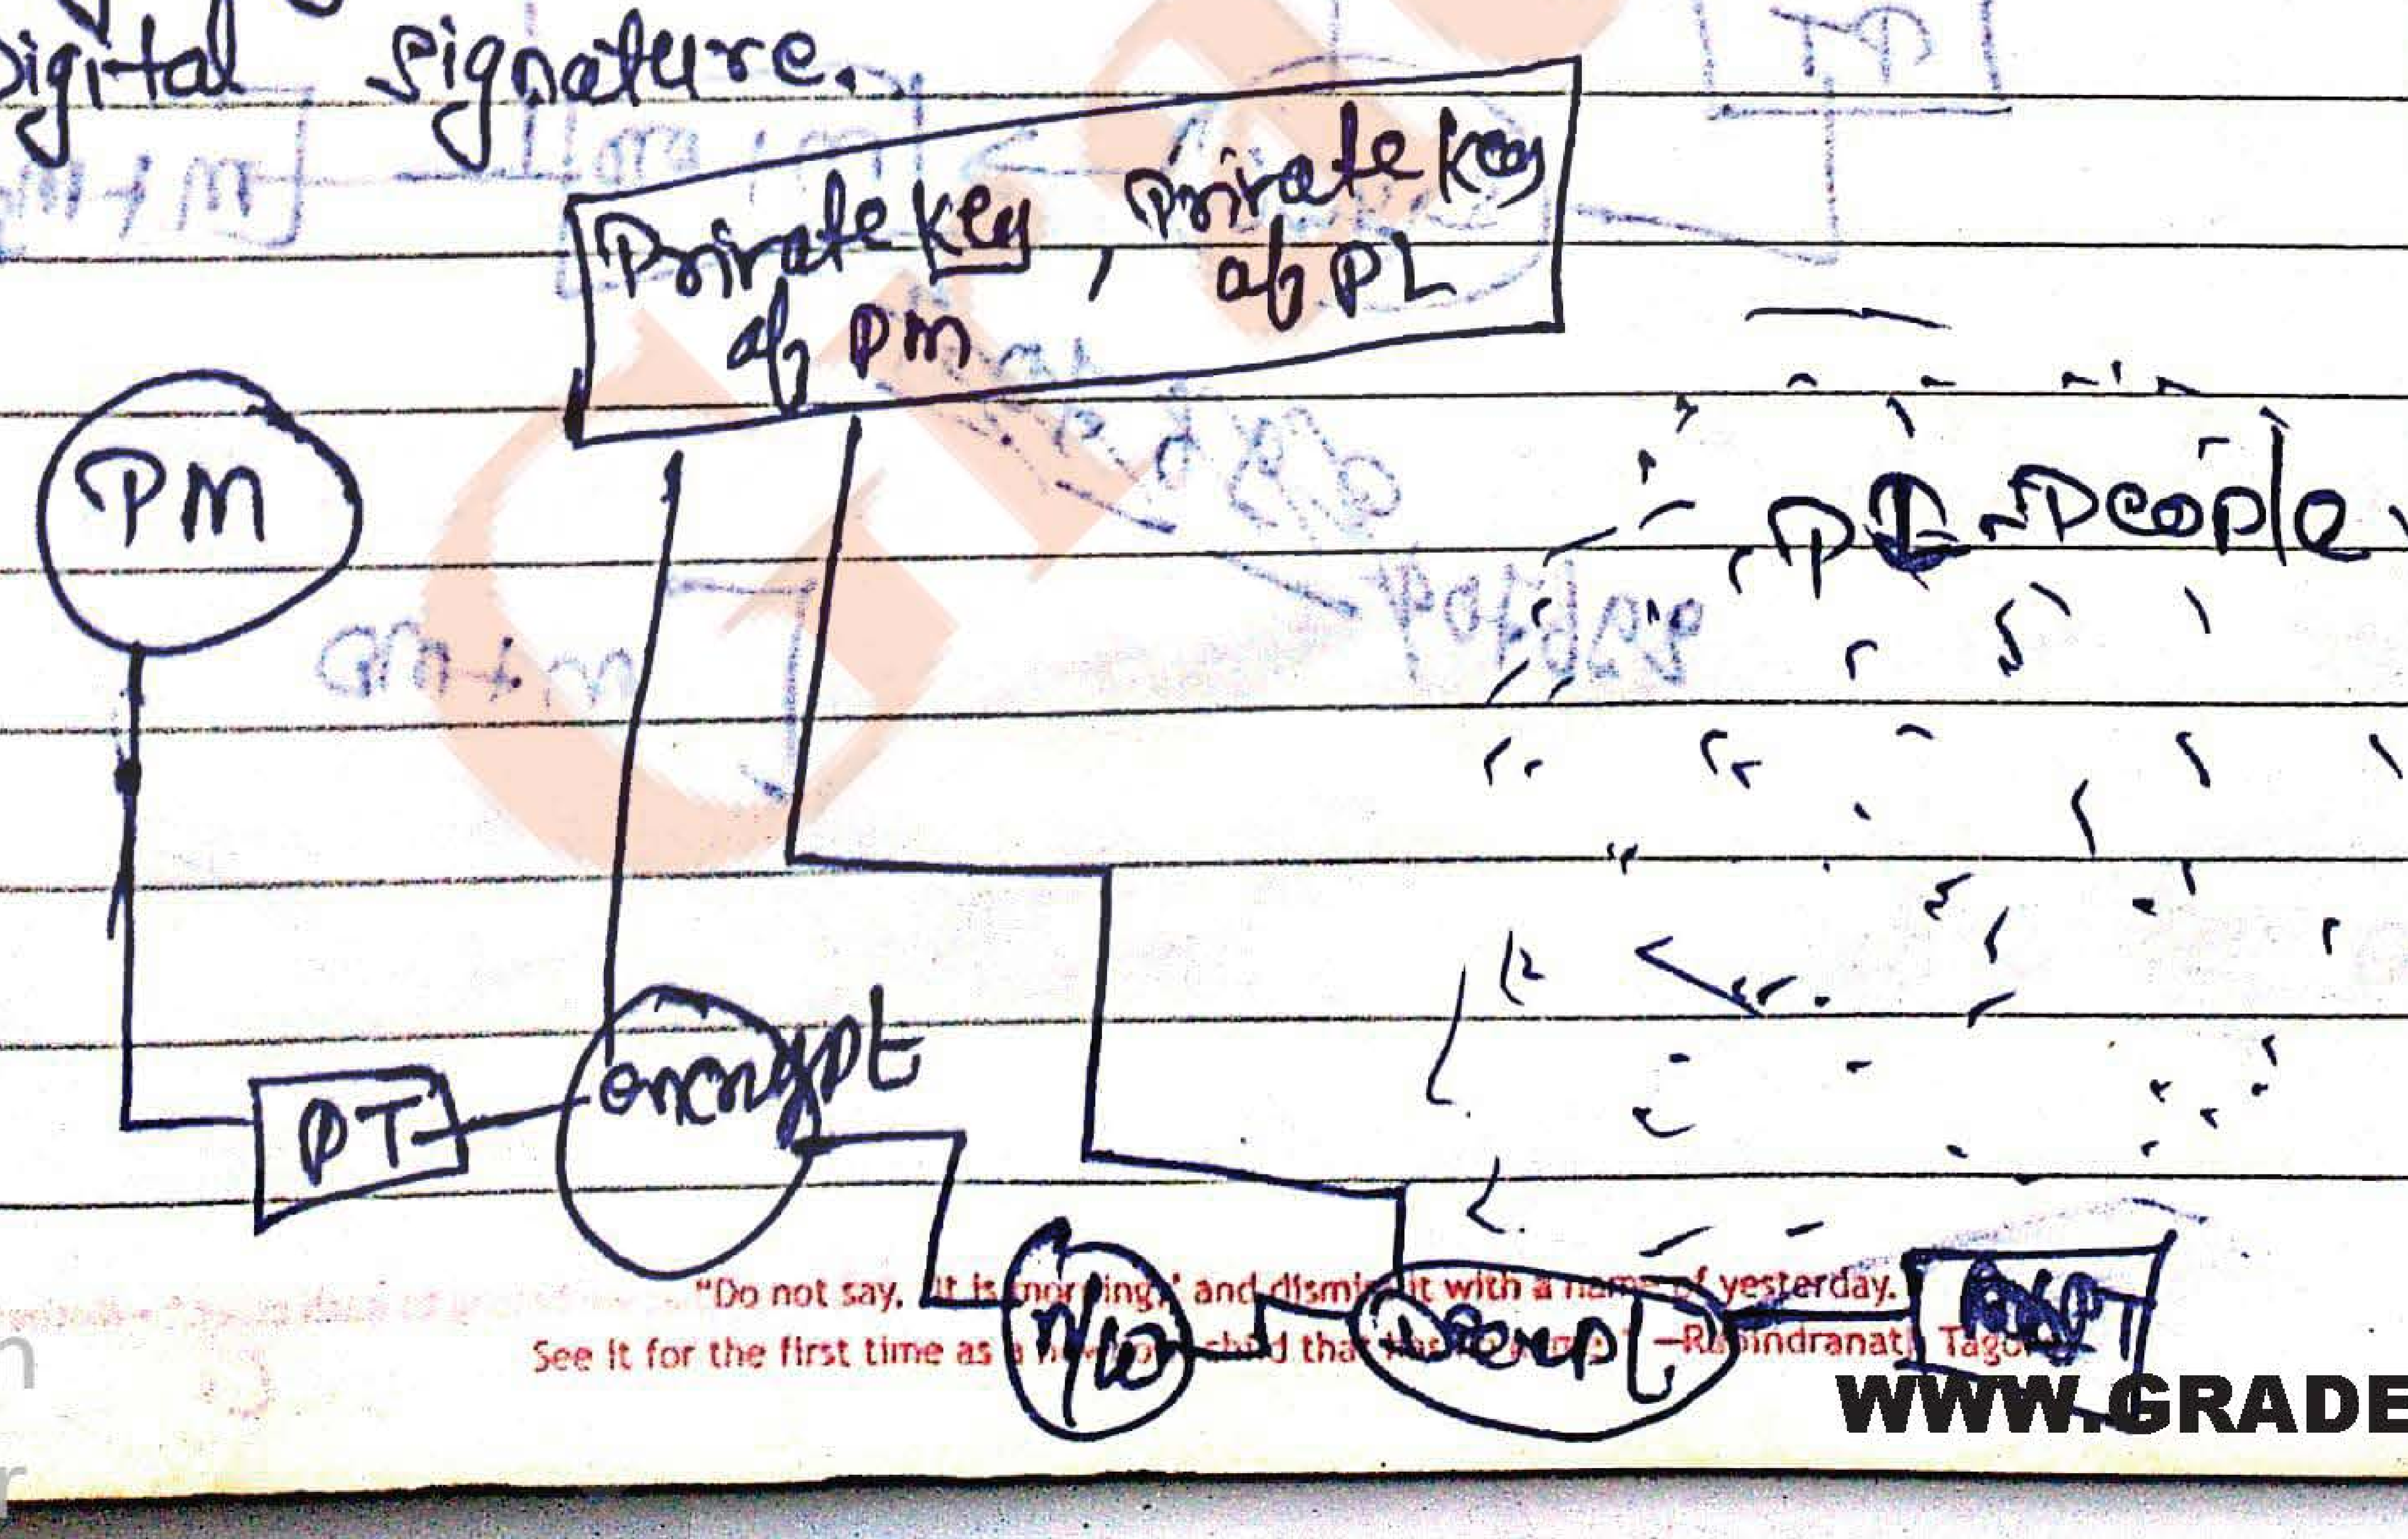


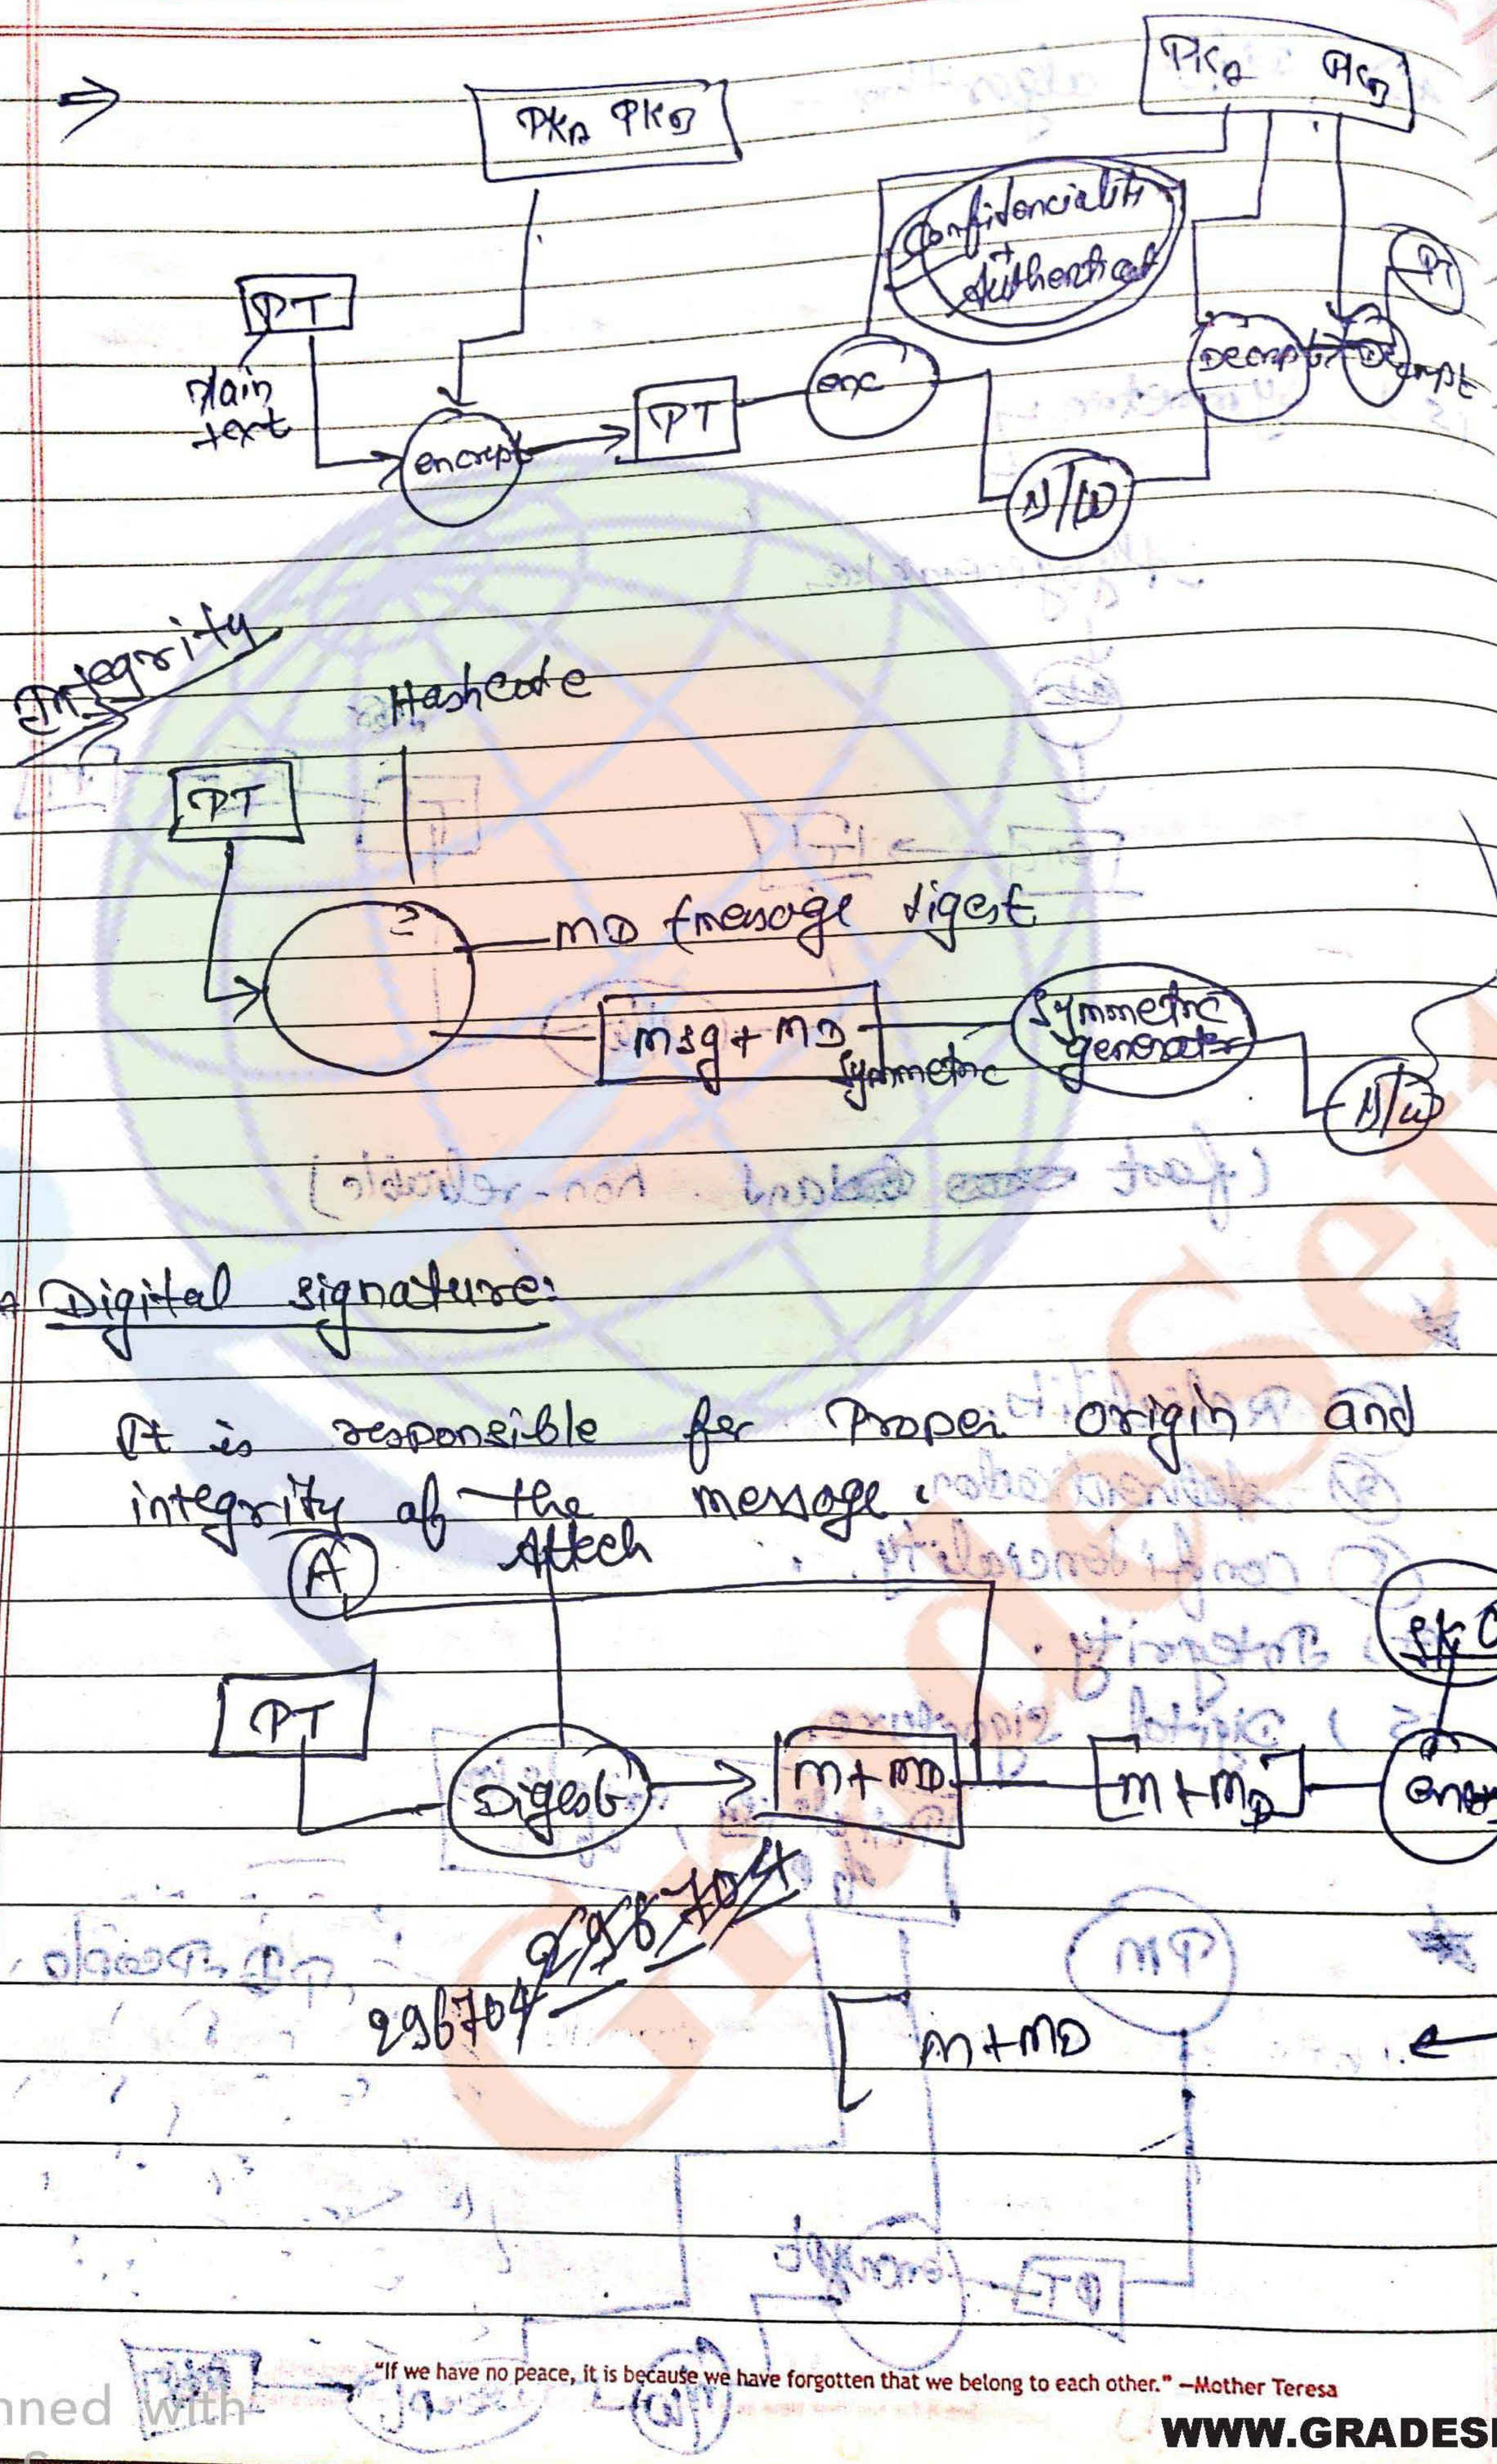
(fast and non-reliable)

★

(1) Reliability.
(2) Authentication.
(3) confidenciality.
(4) Integrity.
(5) Digital signature.

★





* Digital signature:

It is responsible for Proper origin and integrity of the message.

Date / /

Page No.:

★ Hashing :-

Hashing produces a message digest, which is a kind of checksum created on the fixed bit.

It is a basically one way incription, and impossible to derive message from digest.

Hashing algorithm's are much faster than any encryption algorithm.

★ Digital certificate :-

A digital certificate is digital file used to cryptographically bind an entities, public key to specific attribute belong's to it's identity.

eg. Driving licence or passport bind a photograph to a personal info about it's folder.

Same as digital certificate bind a public key to the info about it's owner issued by certification authority.

★ RSA algorithm :-

(Ribat shamir adlimen)

This algorithm is based on difficulty of factorising a large number that have two and only two factors.

The system works on a public key and Private key combination.

"Do not say, 'It is morning,' and dismiss it with a name of yesterday. See it for the first time as a newborn child that has no name." —Rabindranath Tagore

Date __/__/____ Page No.:

Algo:-

Step 1st:-
Two large distinct Prime number 'P and 'Q' must be generated.

Step 2nd:-
Product of these two number's is called as 'n' is a component of the public key. and where

eqn $$d = e^{-1} \bmod \phi(n)$$

should be satisfy.

Step 3rd:-
'e' must be relatively Prime to $\phi(n)$

$$\phi(n) = \phi(p \times q)$$

$$= (p-1) \times (q-1)$$

Step 4:-
We create a description key 'd'

$$d = e^{-1} \pmod{\phi(n)}$$

$$de = (1 \pmod{\phi(n)})$$

'd' is a multiplicative inverse $e \pmod{\phi(n)}$

Note 'd' should always be less than $\phi(n)$

"If we have no peace, it is because we have forgotten that we belong to each other." —Mother Teresa

Q) If p = 3 and q = 11 calculate x

Sol:

$x = e^{\phi(n)}$

p = 3, q = 11

Date / /

Page No.:

★ Diffie Hellman Key exchange Algo.

Any generater G_1 of the group is called primitive root mod P. Suppose G_1 is a primitive root mod P, If G_1^x is equal to y mod P

$$G^x = y \bmod P$$

then discrete logarithm or index of y is

$$\boxed{\text{index}(y) = x \pmod{\phi(P)}}$$

The protocol allows two users exchange their secrete keys over and insecure medium without any prior secrete.

Setup requires:-

(i) Alic and bob agree upon, and make public two numbers.

G_1 and P

where

P is a prime and G_1 is a primitive root mod P.

- Alice chooses a random number a, and computes

$$\boxed{u = g^a \bmod (P)}$$

"If we have no peace, it is because we have forgotten that we belong to each other." —Mother Teresa

and send it to bob.

Bob chooses a random number b and computes

$$v = g^b \bmod(p)$$

and send it to alic.

The key generated by bob is

$$u^b = (g^a \bmod(p))^b$$

$$u^b = g^{a \times b} \bmod(p)$$

and the

$$g^a = (g^{a \cdot b} \bmod(p))^a$$

$$g^{v^a} = g^{b \times a} \bmod(p)$$

1.6 Firewall :-

Trojan and's

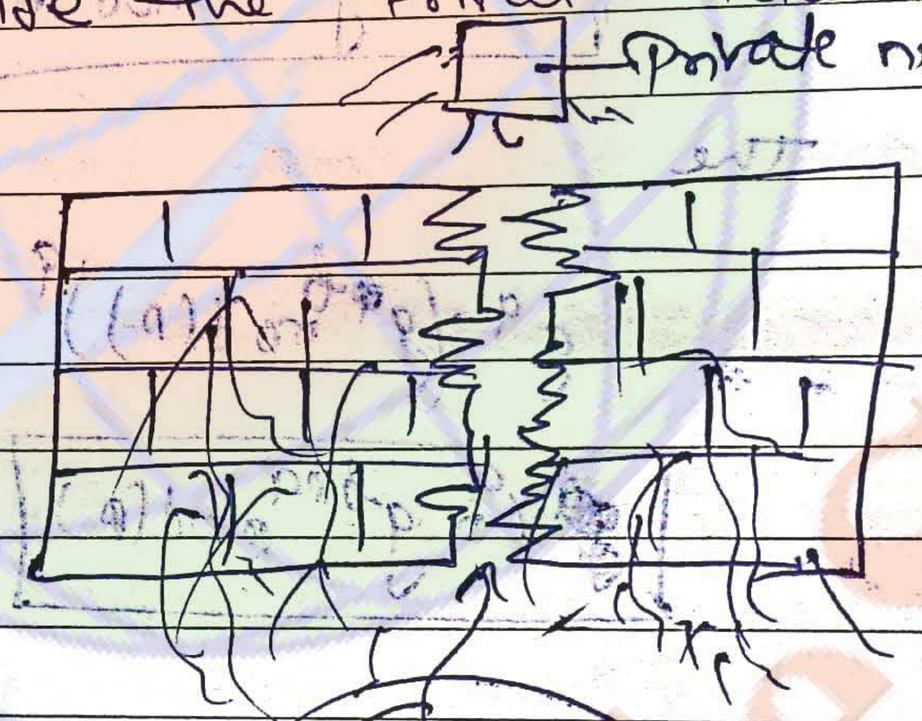
UFD

UBRT

Node

- A firewall is a integrated connection of security measures.
- Design to prevent unauthorized access to a network computer system.

- Firewall policies :-
  - Pre-defined set of rules to protect the isolated system from internet outside the private network.



* Policies actions :-
  - Policies used by firewalls are depending upon some properties of the packets and

Date __/__/____ Page No.: ____

the protocol used.
- Application payload.

* Type of firewall:-

(i) Packet filter,
(ii) Stateful filter's and
(iii) Application layer filter.

(i) Stateless filter
It does not maintain any remembered context or state with resp. to packet. It is processing. Instead it treat each packet attempting to travel through it.

(ii) Stateful:-
It maintenance table for every incoming packet and info within the packet.
(a) ip adres
(b) port adres
(c) and sequence no of the packet of line communication.

* Wifi:-

Date / /

Code words

General Studies:-

(I) ~~Coding scheme~~ All error detection and correction method only work below a certain error rate.

- Frame or code word length $n = m + R$
  - m ↓ data
  - R ↓ redundant or check bits

(II) Any data section having valid, we allow any stream of length 'n' i.e. 0 or 1 bit

(III) Not every code word of length 'n' is valid

(IV) No. of valid code words - very small subset of all possible 0 or 1 bit strings of length 'n'.

Error Correcting

(I) All 2^m patterns are legal, not all 2^n patterns are legal.

(II) The basic idea if illegal pattern find the legal pattern closest to it, that might be the original data.

(iii) Give 2 bit string and bitwise xor gives you no. of bits that are different.

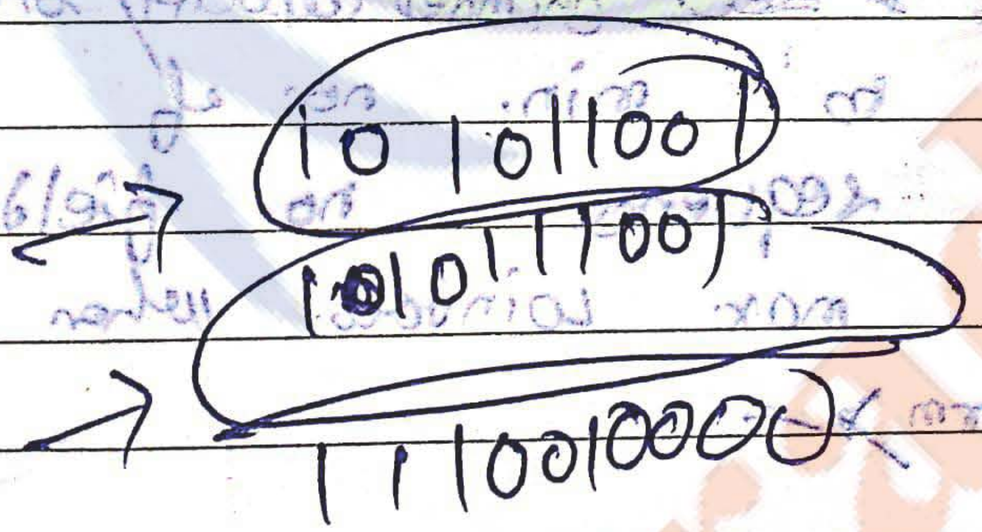
(iv) If two codewords are hamming distance 'd' apart it will take 'd' one bit error to convert one into other.

* Imp Point :-

(a) to detect (but not correct) upto d-errors per length n, you need a coding scheme where codewords are atleast d+1, apart in hamming distance.

Then,
'd' errors can't change 1 into another legal codes so we know there has been a error.

So, To correct 'd' errors need codewords 2d+1 apart. then, even with d-errors bits string will be d-away from original. and d+1 away from the nearest legal code.



a) 4 valid code words, 10 bits
