Data-Structure and algorithm:

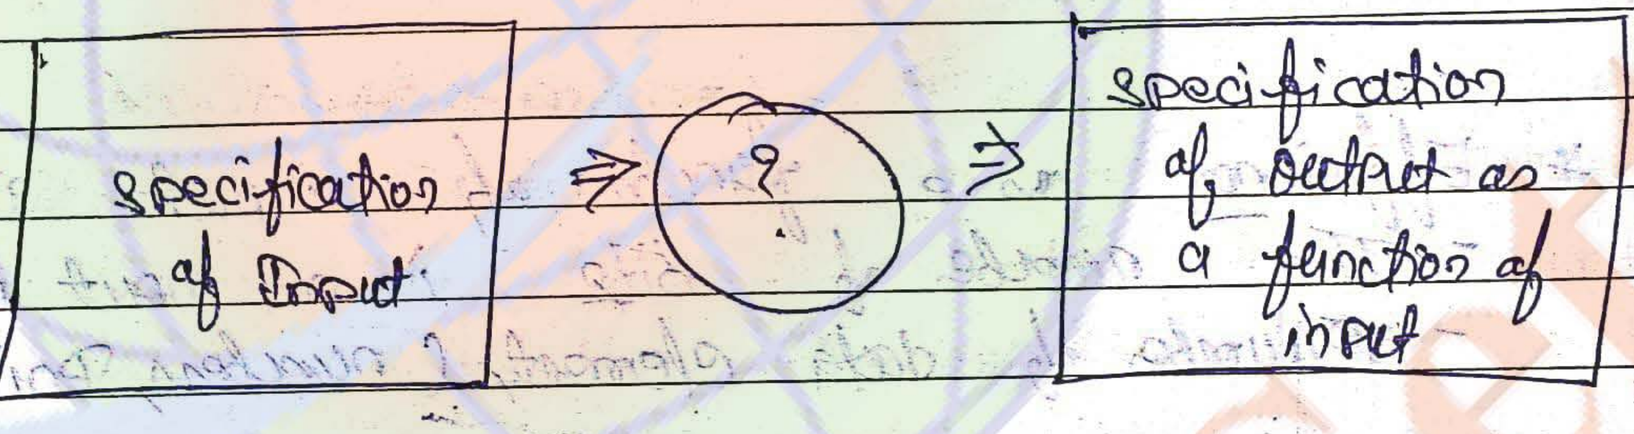
Date __/__/____ Page No.:

(1) Algorithm- outline, the essence of a computational procedure, step-by-step instructs

(2) Program :- An implementation of an algorithm in some Programming language

(3) Data structure:- Organisation of data needed to solve the problem.

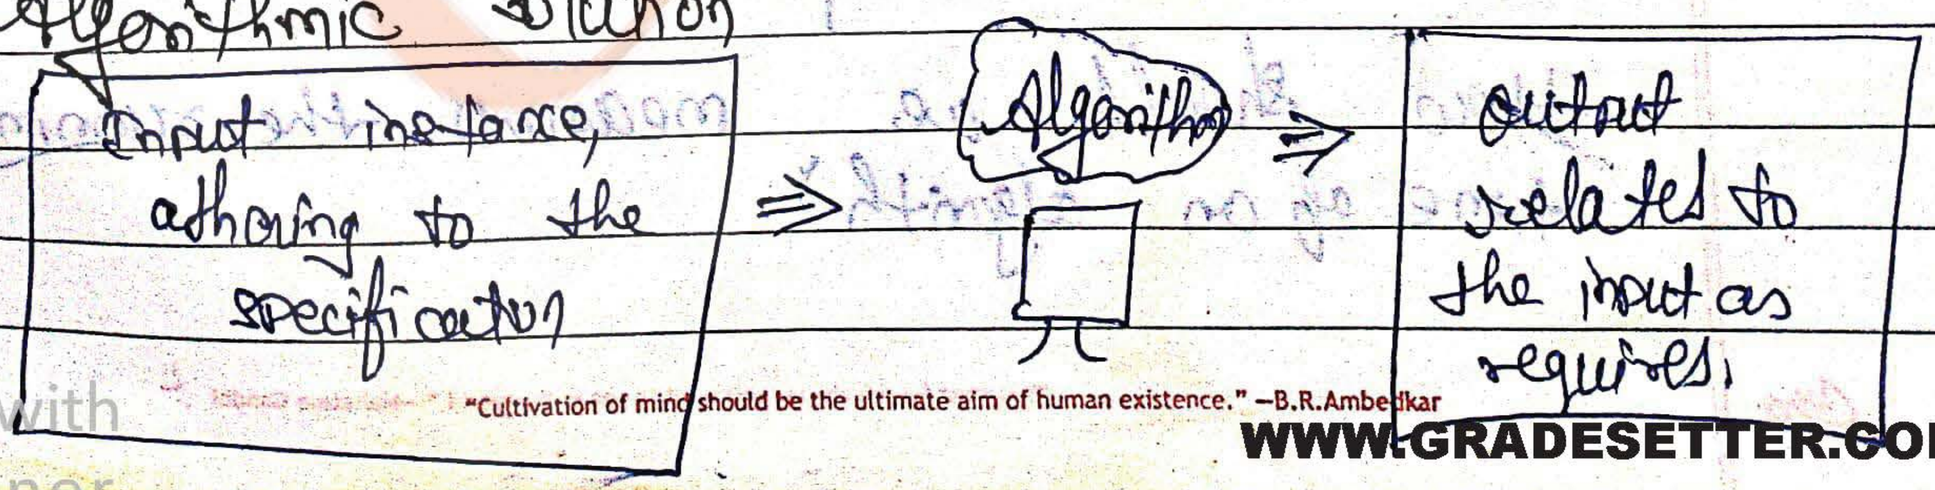
(4) Algorithmic problem:-



- Infinite number of input instances satisfying the specification.
  for eg:- A sorted, non-decreasing sequence of natural number of non-zero, finite length.

  1, 20, 908, 909, 100000, 1000000000
  3

(4) Algorithmic Solution



Date __/__/____ Page No.: ____

- Algorithm describes actions on the input instance.
- Infinitely many correct algorithms for the same algorithmic problem

Q.) What is a good algorithm

- Efficient :-
  - Small running time
  - less space acc.
- Efficiency as a function of input size.

* Efficiency as a function of input size
  - The numbe of bits in an input number
  - Number of data elements (numbers, Points)

Q.) measuring the running time!

How should we measure the running time of an algorithm?

Date __/__/____ Page No.: ____

- Experimental study!-
  - write a program that implements the algorithm
  - Run the program with data sets of varying size and composition.
  - Use a method like "System.currentTimeMillis()" to get an accurate measure of the actual running time.

⇒ Limitations of experimental studies:-

- It is necessary to implement and test the algorithm in order to determine it's running time.
- Experiments can be done only on a limited set of inputs, and may not be indicative of the running time on another input not included in the experiment.
- In order to compare two algorithms, the same hardware and software environments should be used.

P.) Beyond experimental studies:-

We will develop a general methodology for analyzing

BMW का founder QS को हैं। जो problem की आठ वाट कर काम करता है।

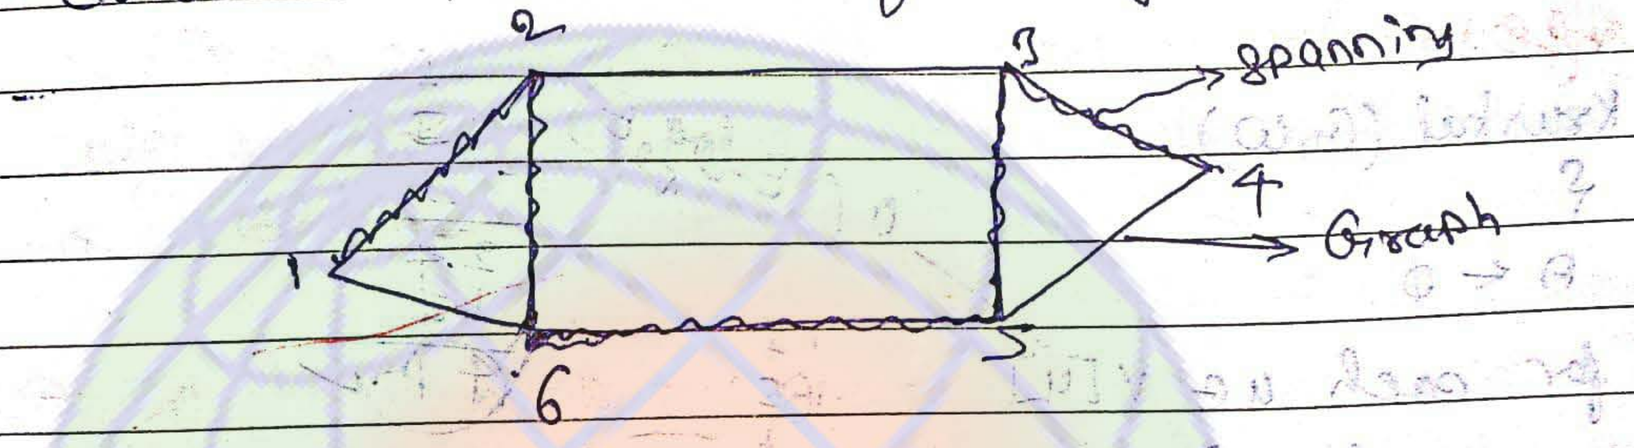
WWW.GRADESETTER.COM

★ Date Minimal Spanning tree:- (min marks = 2 weightage) Page No.

Tree :→ A tree is a connected acylic graph.

• Spanning tree:-

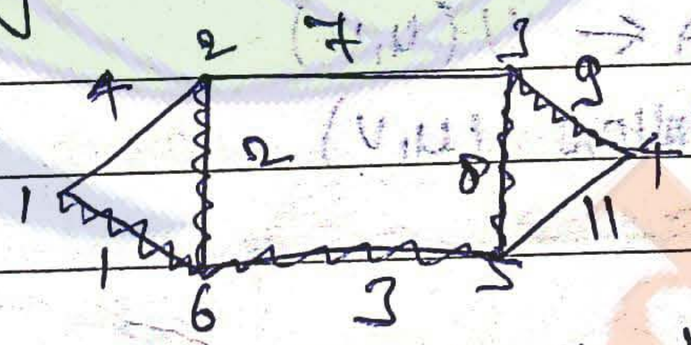
(*) A spanning tree T is a subgraph of a Graph G, such that first it is a tree, 2nd it must cover all the vertices of the graph.



• minimal spanning tree:-

A spanning tree of a weighted graph is said to be minimal if it has the minimal optimal weight.

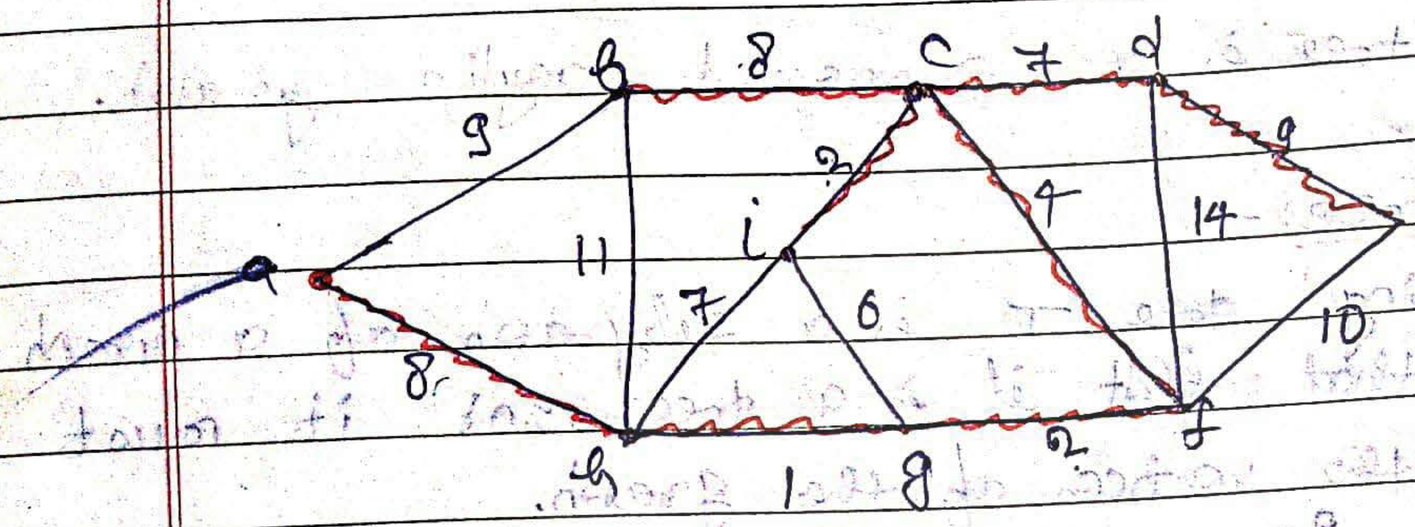
Note:- But uniquness is not guarantee and, we may have some other spanning tree which have the same weight.



(1) Kruskal algorithm:- {Take the lowest value first}

a) Consider a weighted Undirected graph and find a minimal spanning tree using kruskal's algorithm.

Date __/__/____ Page No.: ____



Ans = 41.

Algo:-

Kruskal (G, w)

{

$A \leftarrow \phi$

for each $u \in V[G]$

makeset(u)

sort the edge $(u,v) \in E(G)$ in non-decreasing order

for each edge $(u,v) \in E(G)$ taken in non-decreasing order

{

if {find set(u) $\neq$ Find set(v)}

{

$A \leftarrow U(u,v)$

UNION (u,v)

}

}

return A

$O(E \log_2 E)$

Note:-

makeset(u) :- makeset is a function which is when called on a vertex v, makes it a tree or convert it into a tree.

Find set of v :- find set of v is a function which is when called on a vertex, will give the

set of all the vertex, which are rechable from U.

C :- we check this condition c, because we find the vertex u and v already connected or not.

Because if yes, then the inclusion of the edge "u, v" will lead to a cycle. and that will be a problem.

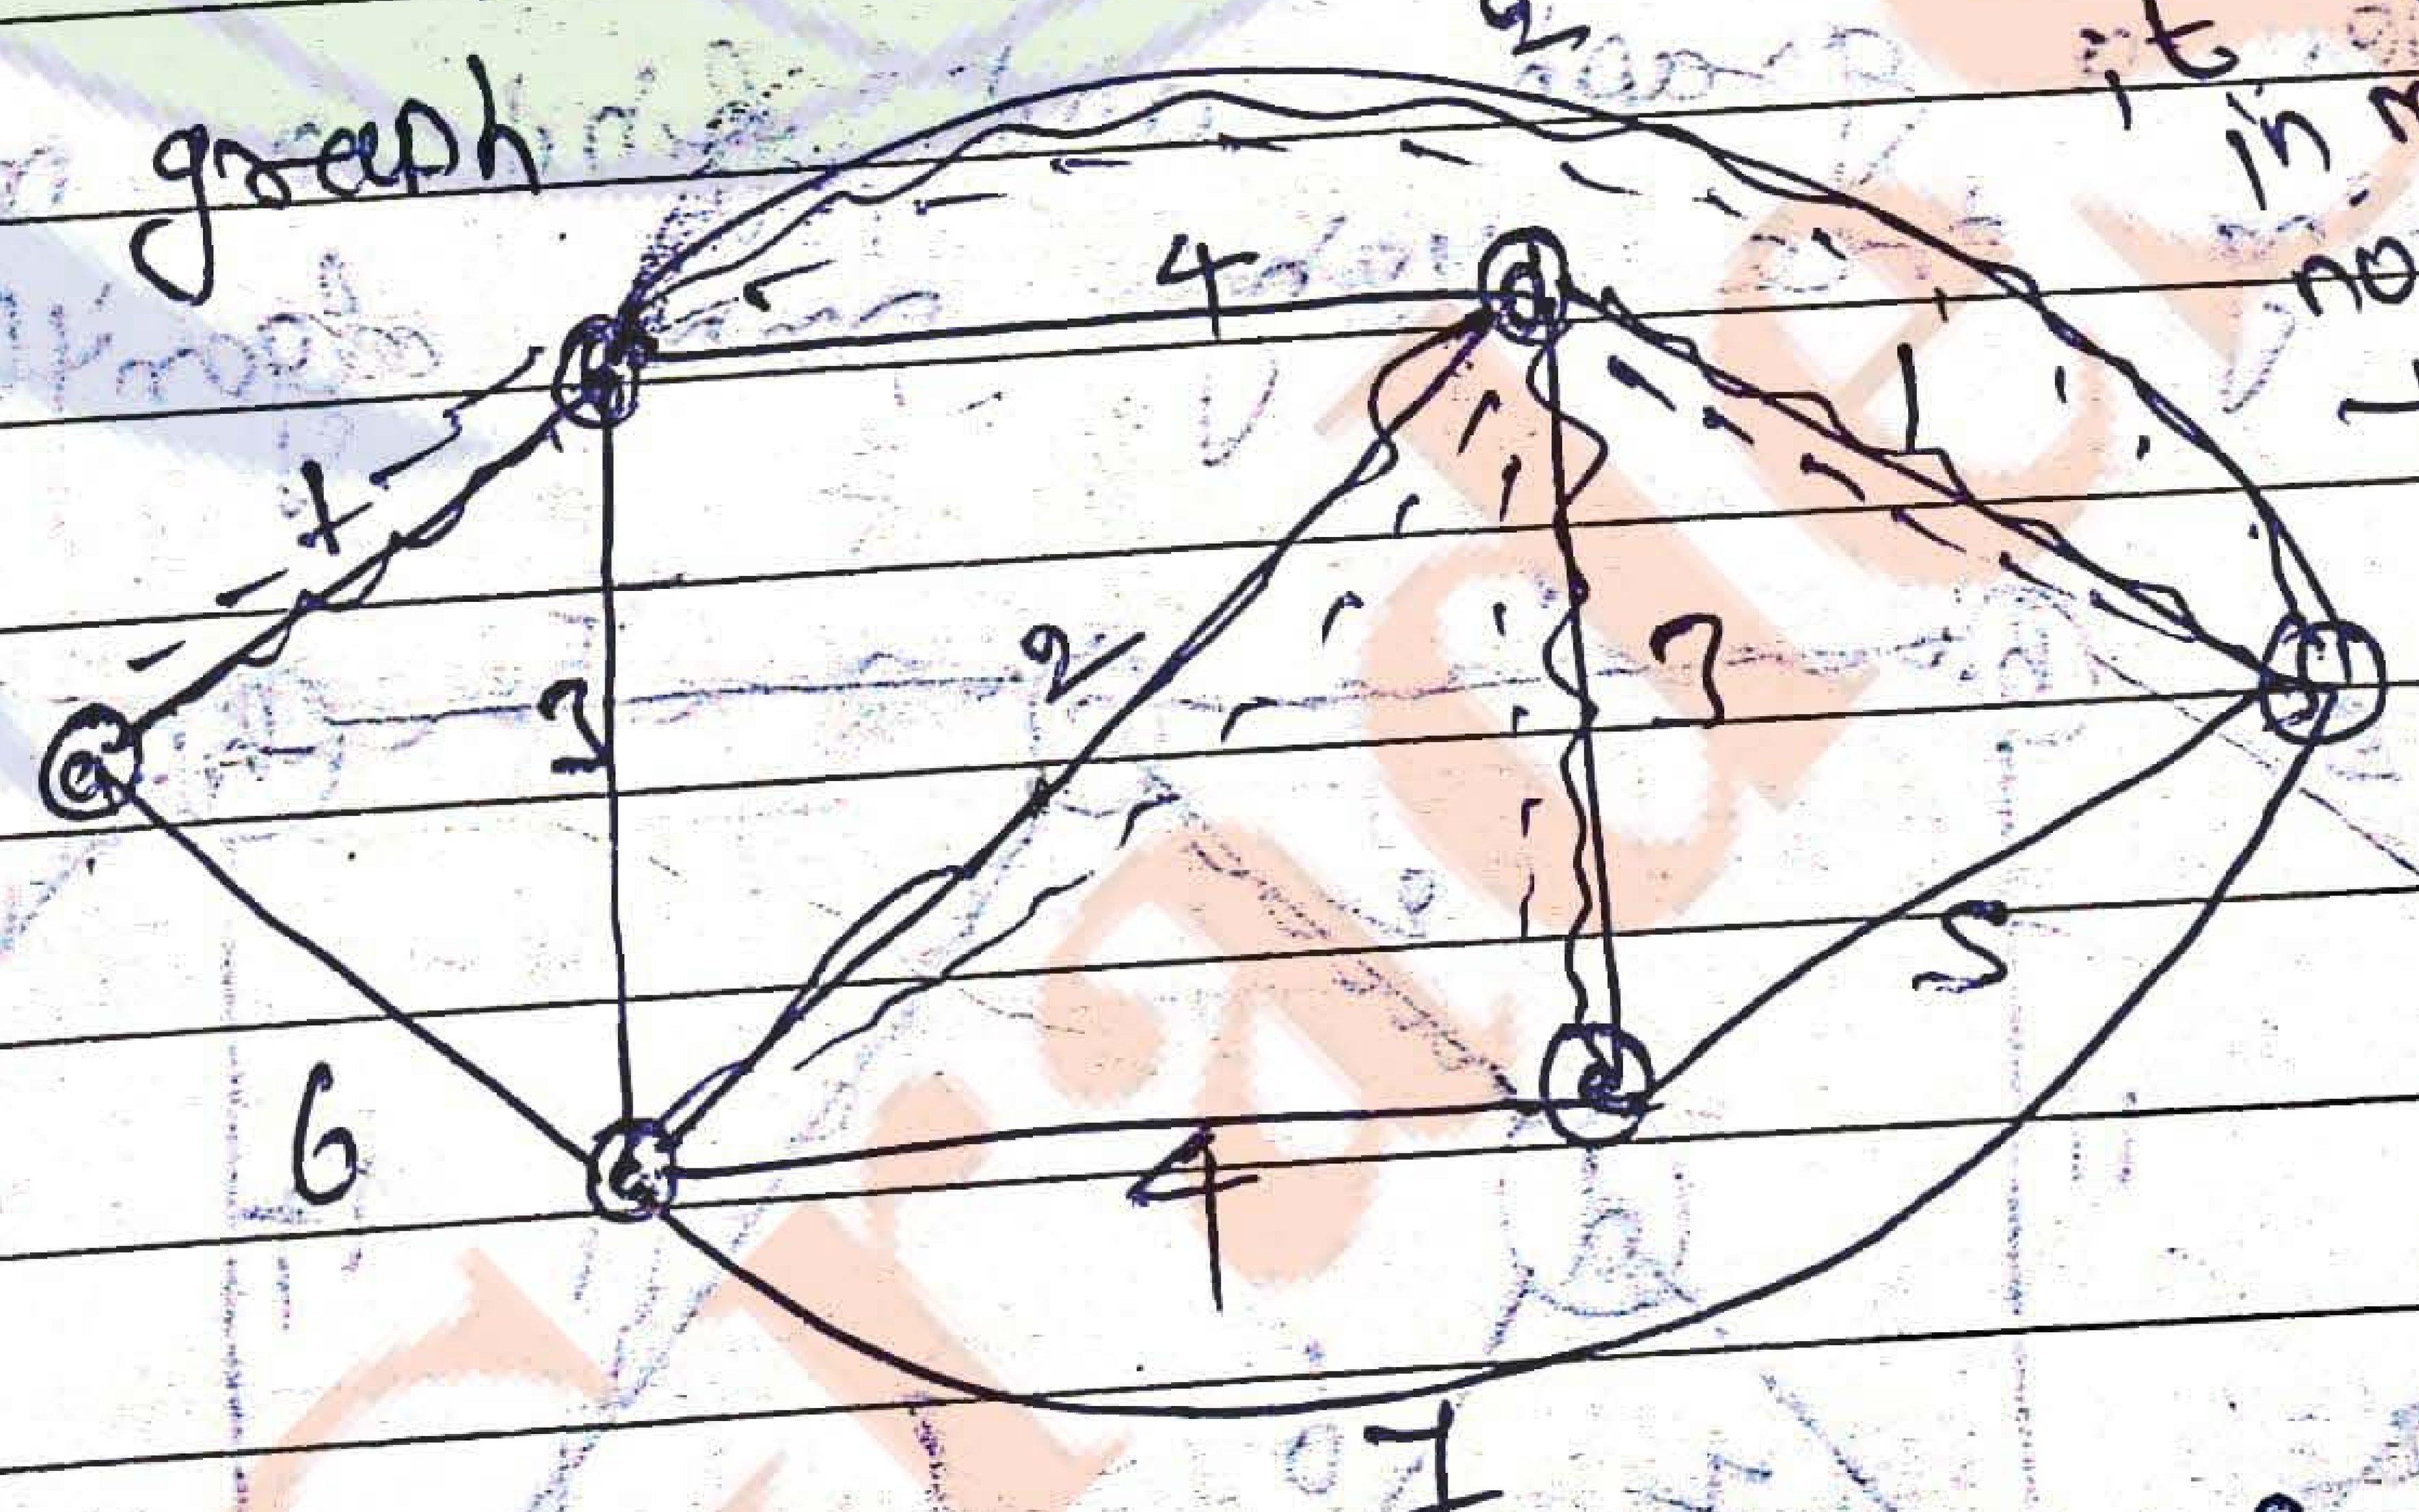
* Important Point :-
* Kruskal works on a purely greedy approach being greedy about weight.

* It guarantee to give optimal soln (Uniqueness is not guarantee)

* The cost of $O(E \log_2 E)$

Methods:- (Note:) The methods of solving of this type of problem is to start with the minimum value, and in the sequence you increase it to keep the thing in mind that there is no cycle formation takes place.

Q1.) Consider a graph



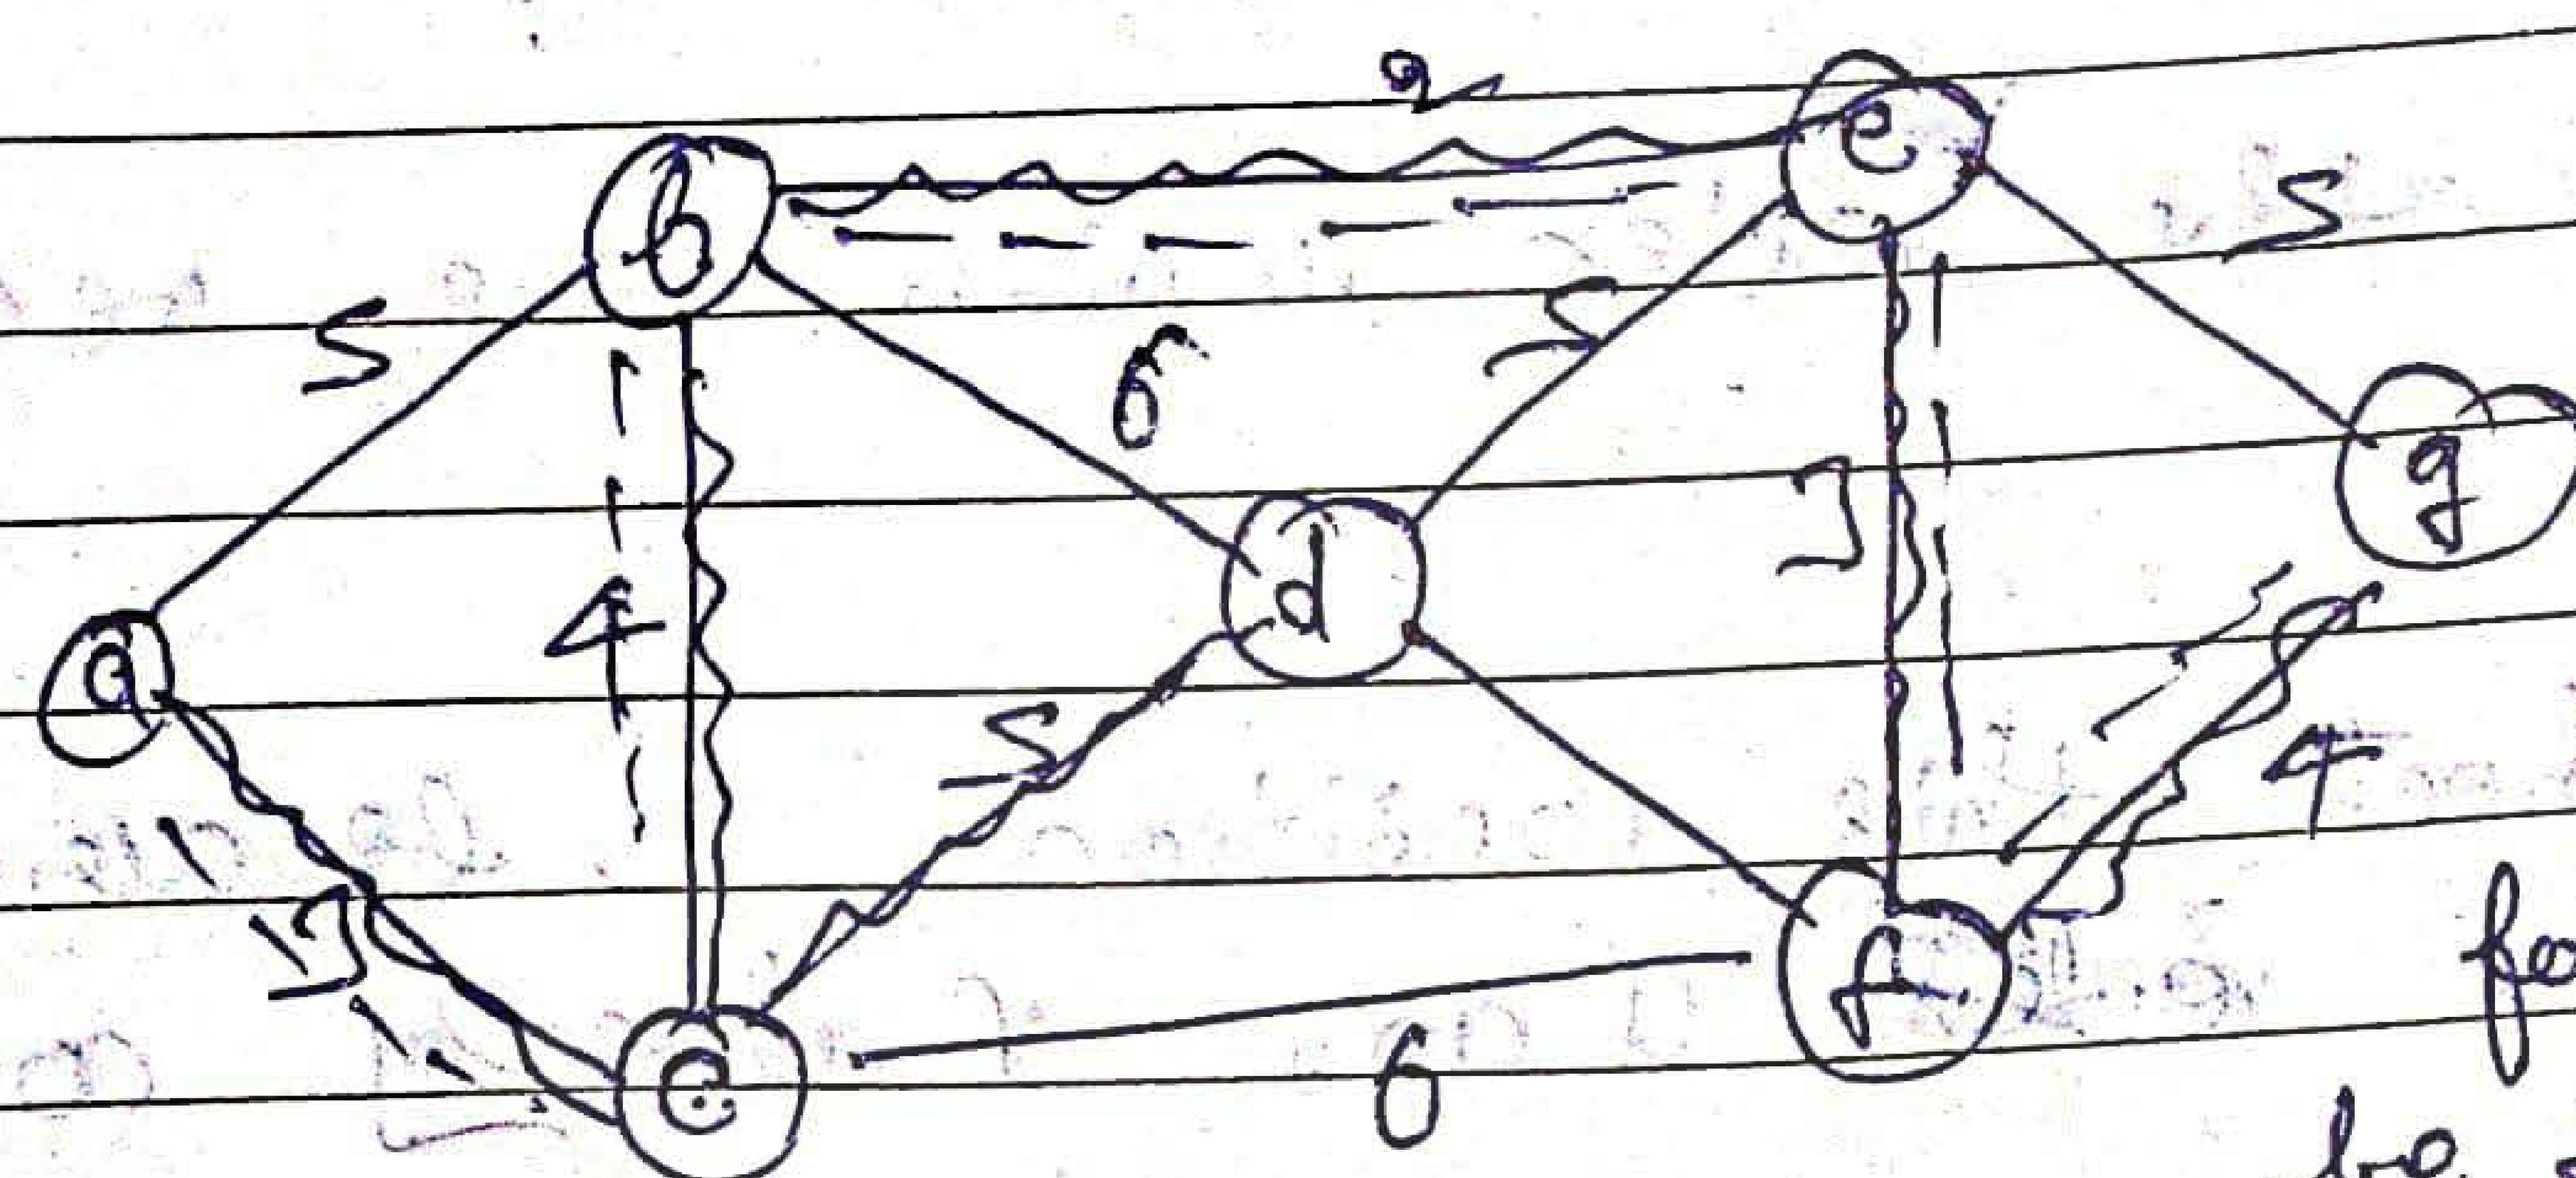
which of the following can not be the sequence of edges added if kruskal is used.

ab, bf

(a) ab df bf dc de
(b) ab df dc bf de
(c) df ab dc bf de
(d) df ab bf de dc → This cannot be allowed.

Chitra

Q2)



which of the following can not be sequence in kruskals algorithm:-

(a) $\overset{2}{be}$ $\overset{3}{ef}$ $\overset{3}{ac}$ $\overset{4}{bc}$ $\overset{4}{fg}$ $\overset{5}{ed}$ ✓

(b) $\overset{2}{be}$ $\overset{3}{ef}$ $\overset{5}{ac}$ $\overset{4}{fg}$ $\overset{4}{bc}$ $\overset{5}{cd}$ ✓

(c) be ac ef bc fg ed

X (d) $\overset{2}{be}$ $\overset{3}{ef}$ $\overset{4}{bc}$ ac fg cd

↑ we have left 3, so we not take 4 before 3.

★ Prim's algorithm:-

{ • start from root node, which you assume

Q) Consider a graph and find a minimal spanning tree using prims algorithm

	a	b	c	d	e	f	g	h	i	
parent π(u)	–	a	–	e	a	e	–	–	–	
distance d(u)		9	∞	7	1	1	∞	∞	∞	

Date __/__/____ Page No.: _____

```
Prims (G, w, r)
{
  for each u ∈ V(G)
    {
      π[u] ← ϕ
      d[u] ← ∞
    }
  d[r] ← 0
  Q ← V[G]
  while Q ≠ ϕ
    u ← delete min(Q)
    for each v ∈ adj(u)
      if (v ∈ Q) && (w(u,v) < d[v])
        {
          d[v] ← w(u,v)
          π[v] ← u
        }
    }
}
```

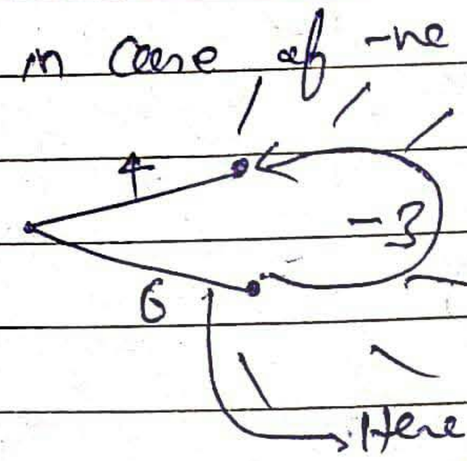
u = e

a, b, f, d

↳ Here, we first take all the distance as infinity(∞) and by using parity queue, we apply the minimum distance as then after, it select it. Do the same process for each of the node.

Date __/__/____ Page No.: ____

Note:⇒ Fails in case of -ve



Here due to -ve value we not get better with 6, but we not know in initial so, prims fails for -ve values.

✱ ⇒ Important point:-

(i) Prim algorithm also work on greedy approach.

(ii) Prims also guarantee to give optimal solution

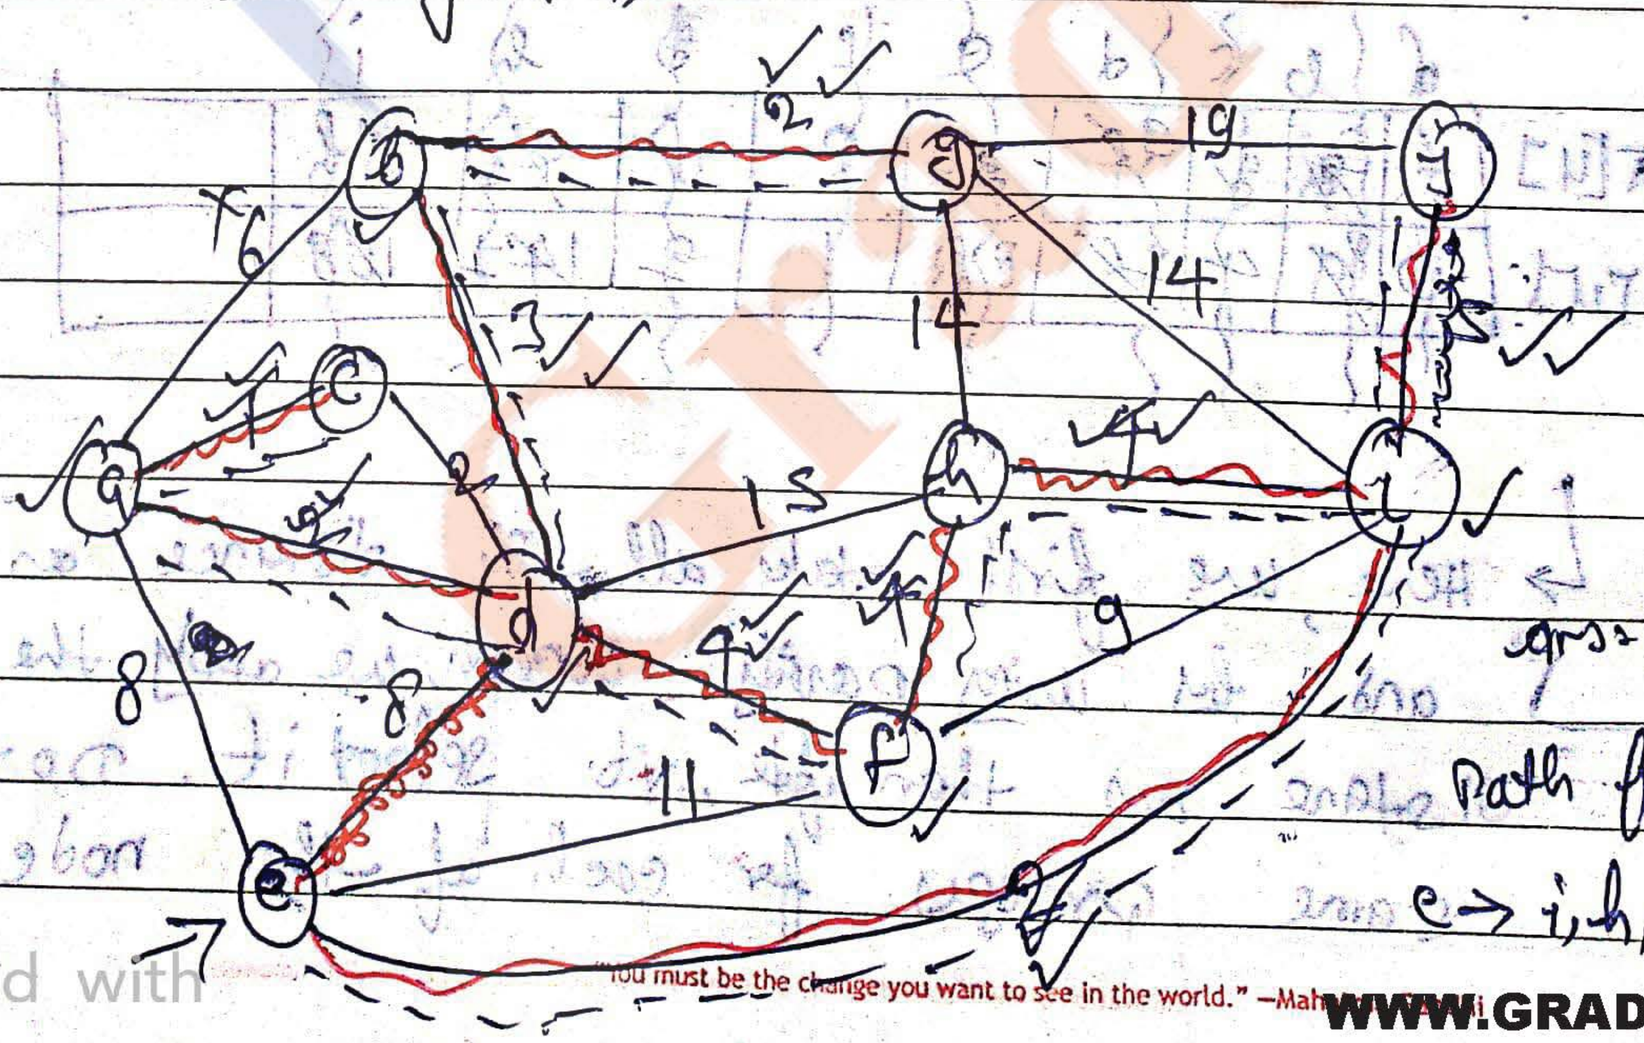
(iii) Uniqueness is not guarantee, by running Prims on diffb. root or diffb starting vertex, we may have diffb spanning tree, but the cost will be same.

(iv) On negative(-ve) weight Prims may fails because in that case local optima may or may not be global optima.

1+

2007 Q:) Consider a graph,

27



Path from e:-

e → i, h, f, d, a, c, b, g, j

Date __/__/____ Page No.: _____

- If the cost or the weight of every edge is distinct then the tree will be unique. irrespective of the algo or the starting vertex used.
- If we have two different ~~minimal~~ minimal spanning tree in a graph then it implies atleast two edges with the same weight.
- In the best case, the complexity of Prims will be $O(E \log_2 V)$

Date __/__/____ Page No.: ______

★ Single source shortest Path:-

↳ min mark = 2

Q) Consider a graph G, which is a weighted directed graph, the problem is from any vertex called source vertex, we have to find the shortest Path to all the other vertex of the graph.

weight in general can be (+)ve as well as (−)ve.

(i) Dijkastra algorithm:-

Dijkastra (+ve only):-

इसमें हम source से सारे point का distance लिखते जाएंगे कितना possible है, और फिर इसमें से "shortest" निकाल इसमें जितना "सबसे कम distance" होगा, उसको vertex मानकर आगे find करेंगे

	s	a	b	c	d
π[u]	–	c	a	s	c
d[u]	0	8	9	5	7

a(8) ⟸ c ⟸ s

b(9) ⟸ a ⟸ c ⟸ s

c(5) ⟸ s

d(7) ⟸ c ⟸ s

Date __/__/____ Page No.: ____

Algo:-

~~Dijkastra (G,w,s)~~

```
Initialize single source(G,s)
{
for each v∈ V(s)
  {
    π[v] ← ϕ
    d[v] ← ∞
  }
d[s] ← 0
}

Relax (u, v, w)
{
if (d[v] > d[u] + r[u,v]
  d[v] ⇐ d[u] + u(u,v)
  π[v] ⇐ u
```

```
dijkastra (G, w, s)
{
initialize single source (G,s)
A ← ϕ
Q ← V[G]
while Q ≠ ϕ
  u ← delete min(Q)
  A ← A ∪ [u]
for each v ∈ adj[u]
  if (u ∈ Q)
    relax (u, v, w)
return (A)
}
```

Conclusion:-

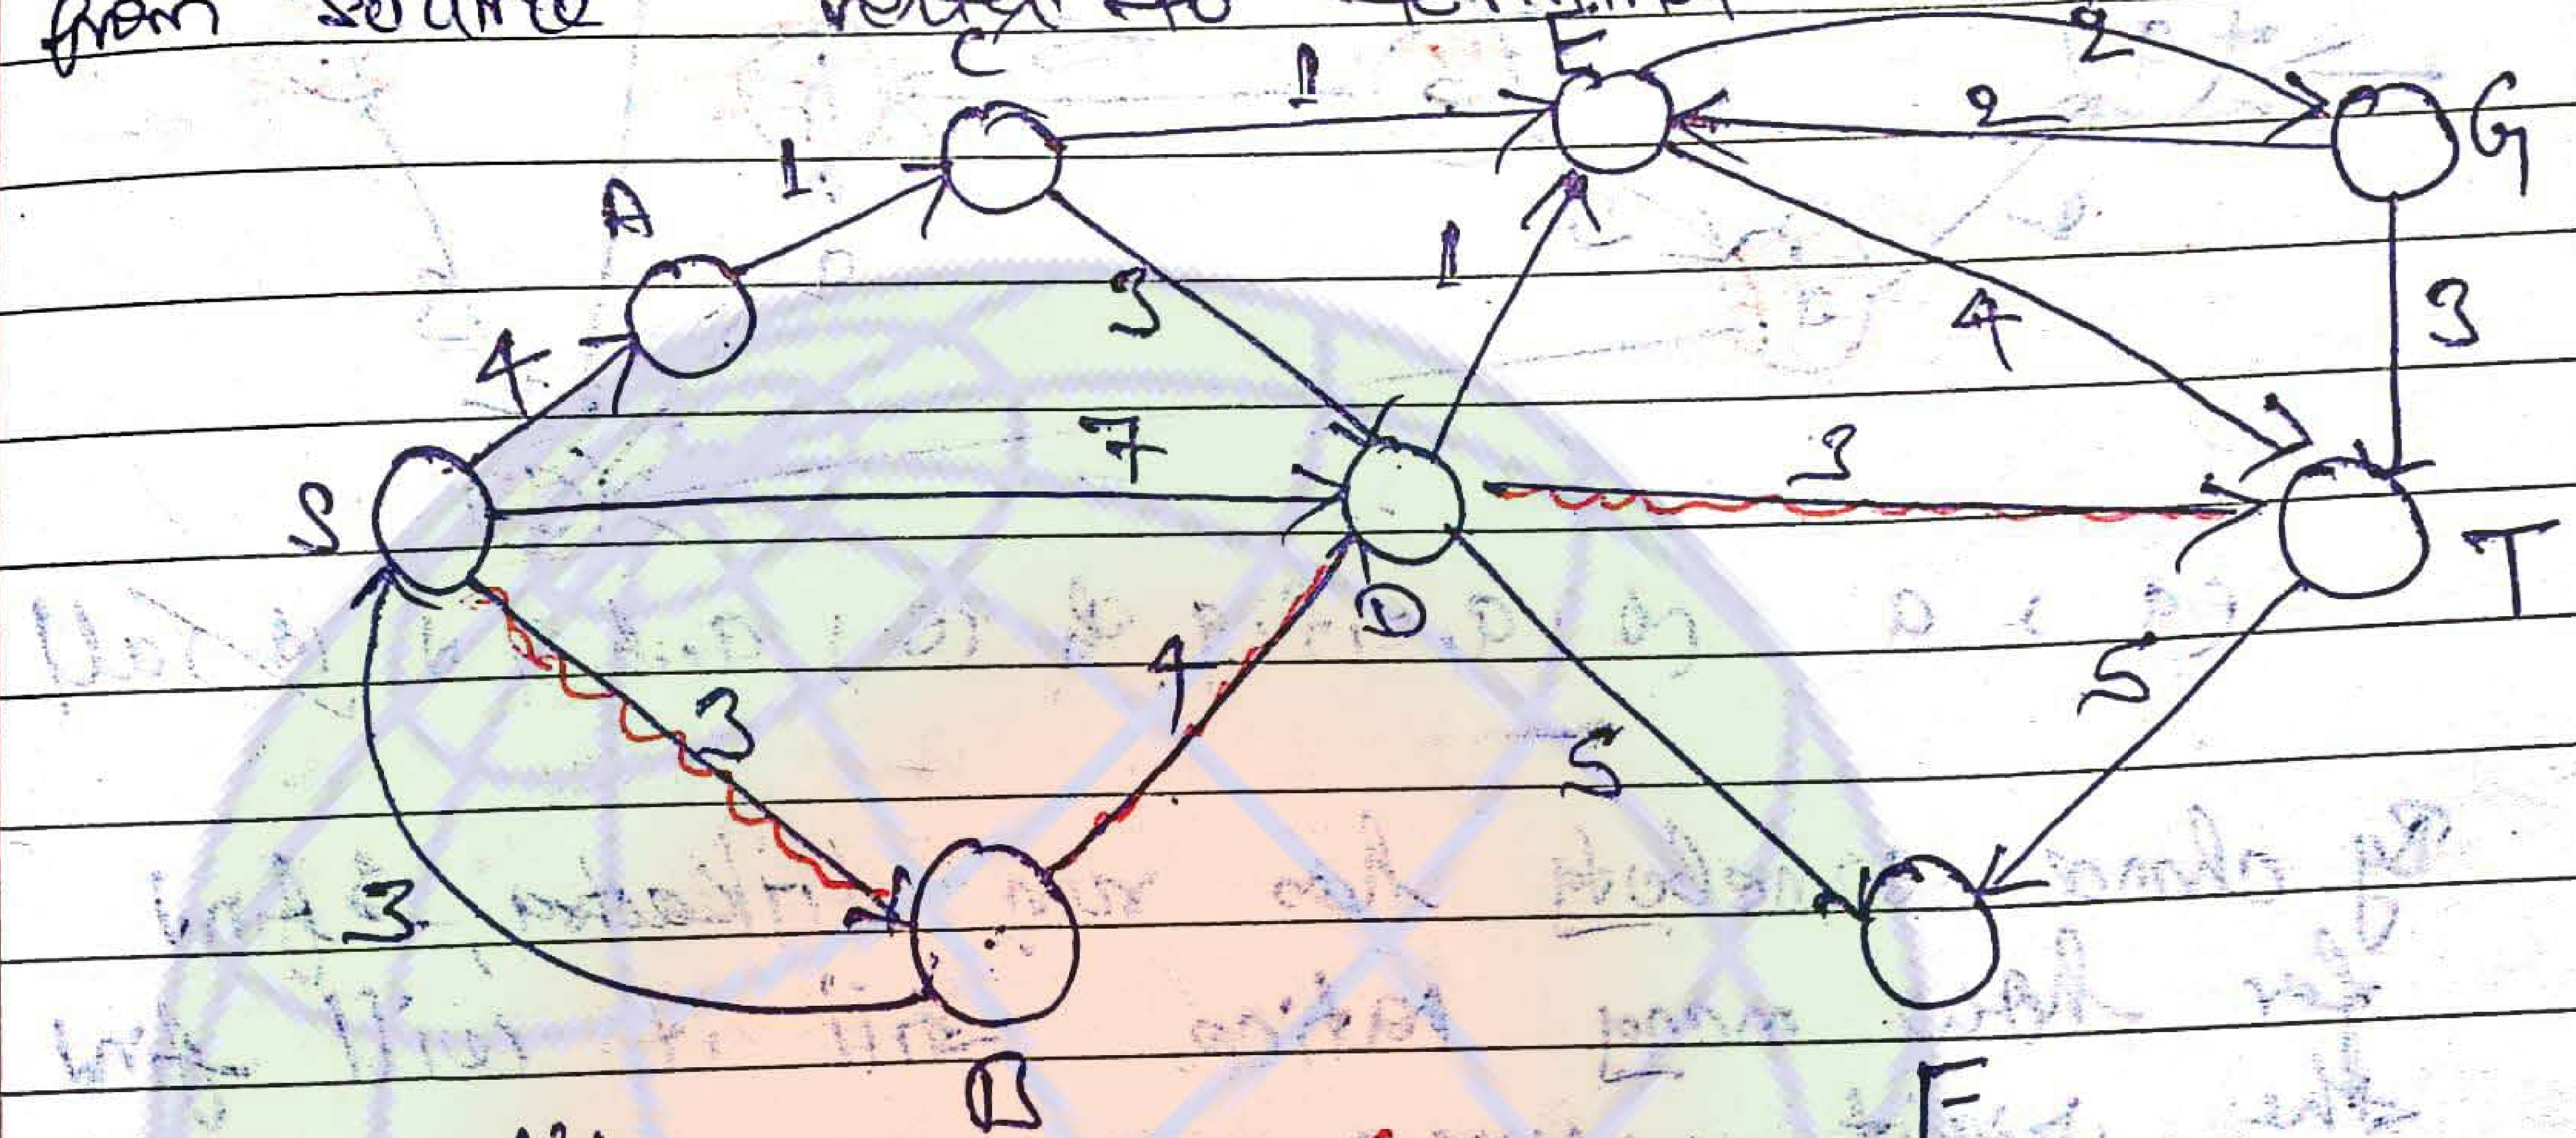
(i) It works on a pure greedy approach being greedy about waght.

(ii) It guarantees to give minimal cost path from every vertex from the source vertex.

(iii) Dijkastra may fail with -ve weight edges.

(iv) minimum cost $O(V \cdot \log_2 V)$

Q) consider a graph and find the minimum distance, from source vertex to terminal vertex.



Dijkstra path:-

(a) S D T
(b) S B D
(c) S A C D T
✓(d) S A C E T

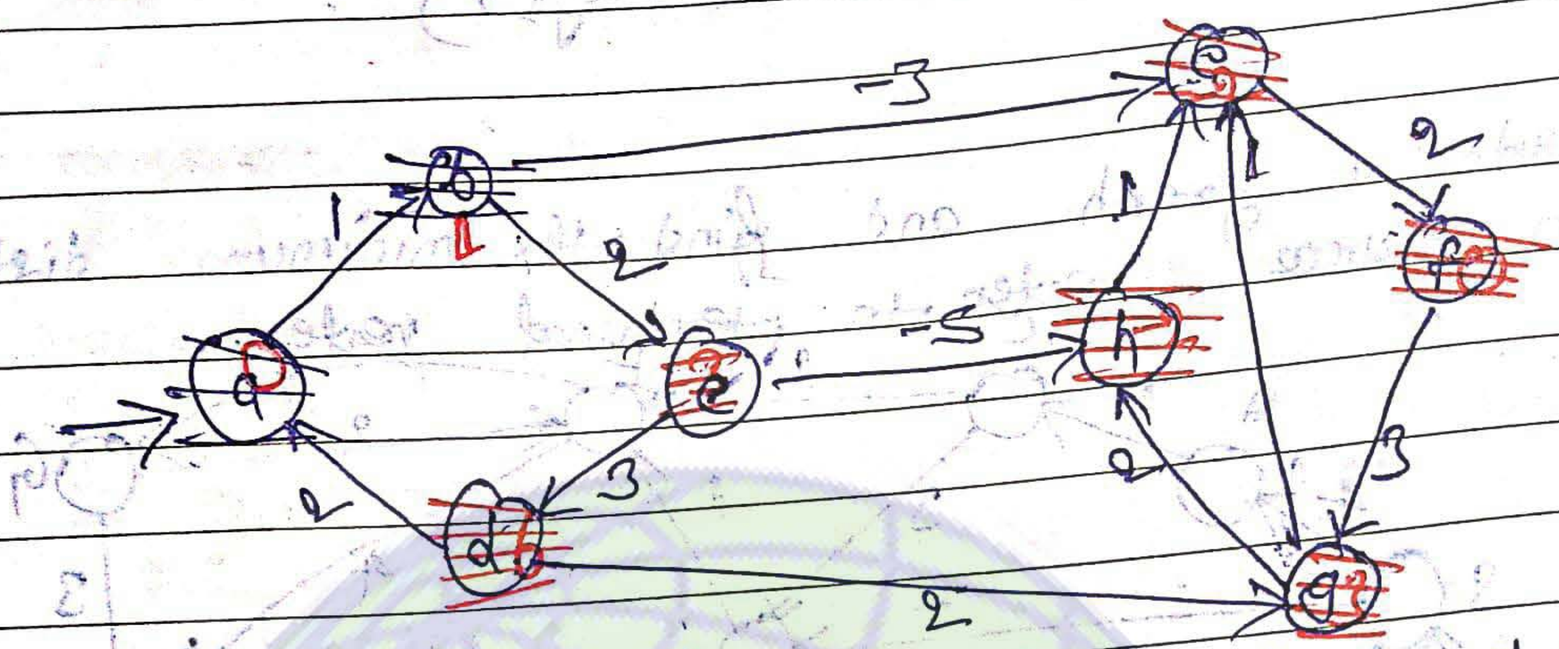
	S	A	B	C	D	E	F	G	T
π[u]	-	A	S	-	B	D	D	-	D
d[u]	0	4	3 ∞	∞	4	∞ 1	∞ 5	∞	∞ 3

	S	A	B	C	D	E	F	G	T
π[u]	-	S	S	A	S	C	D	E	E
d[u]	0	4	3	5	7	6	12	8	10

S → S → C → E → T

Date __/__/____ Page No.: ____

Q) Consider a graph



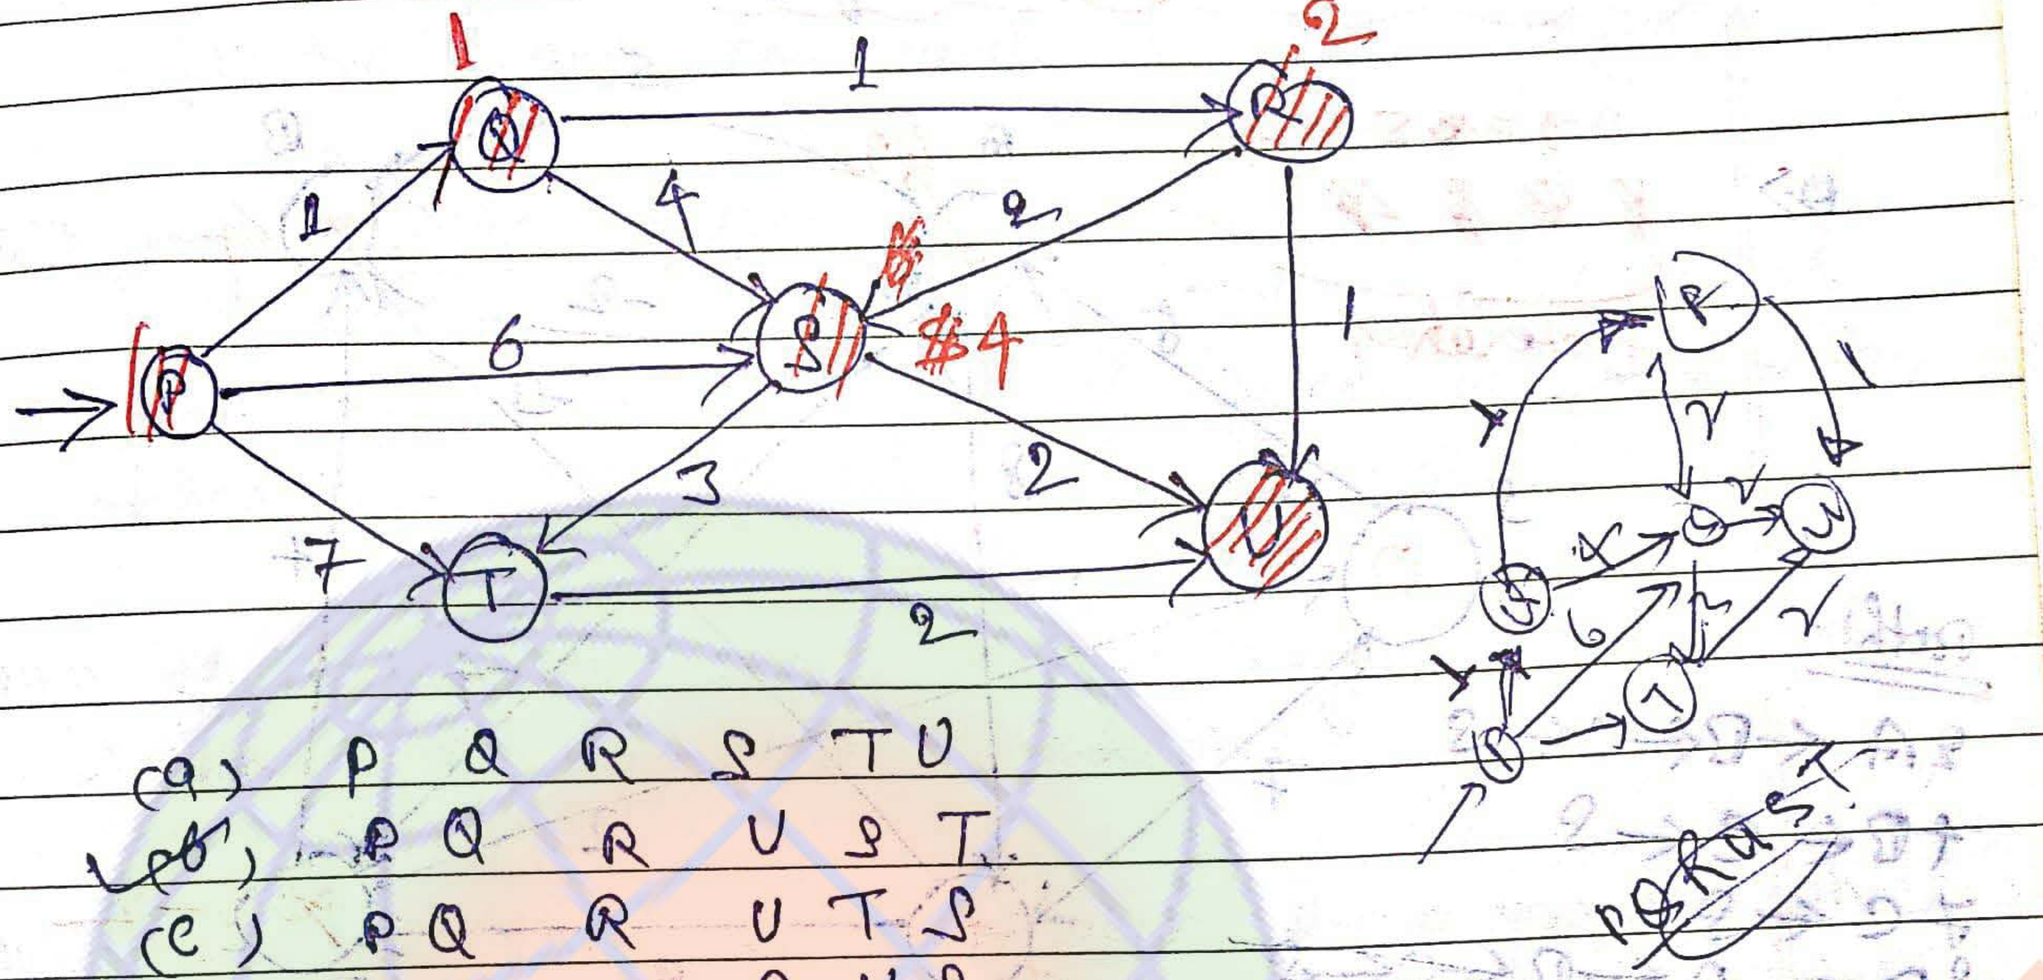
(a) a (b) a, e, f, g, h (c) a, b, c, d (d) all

By chance somebody has run dijkastra, & found for how many nodes still it will find the right answer.

Hint) → To check the shortest path after each relax.

Date __/__/____ Page No.: _____

Dear Gear Q. Consider a graph



(a) P Q R S T U
(b) P Q R U S T
(c) P Q R U T S
(D) P Q T R U S

In what order, node get finalize if dijkastra will ~~allows~~ start from P.

So/n

	P	Q	R	S	T	U
π[u]	—	P	Q	R	P	R
d[u]	0	1	1	4	7	2

Bellman form

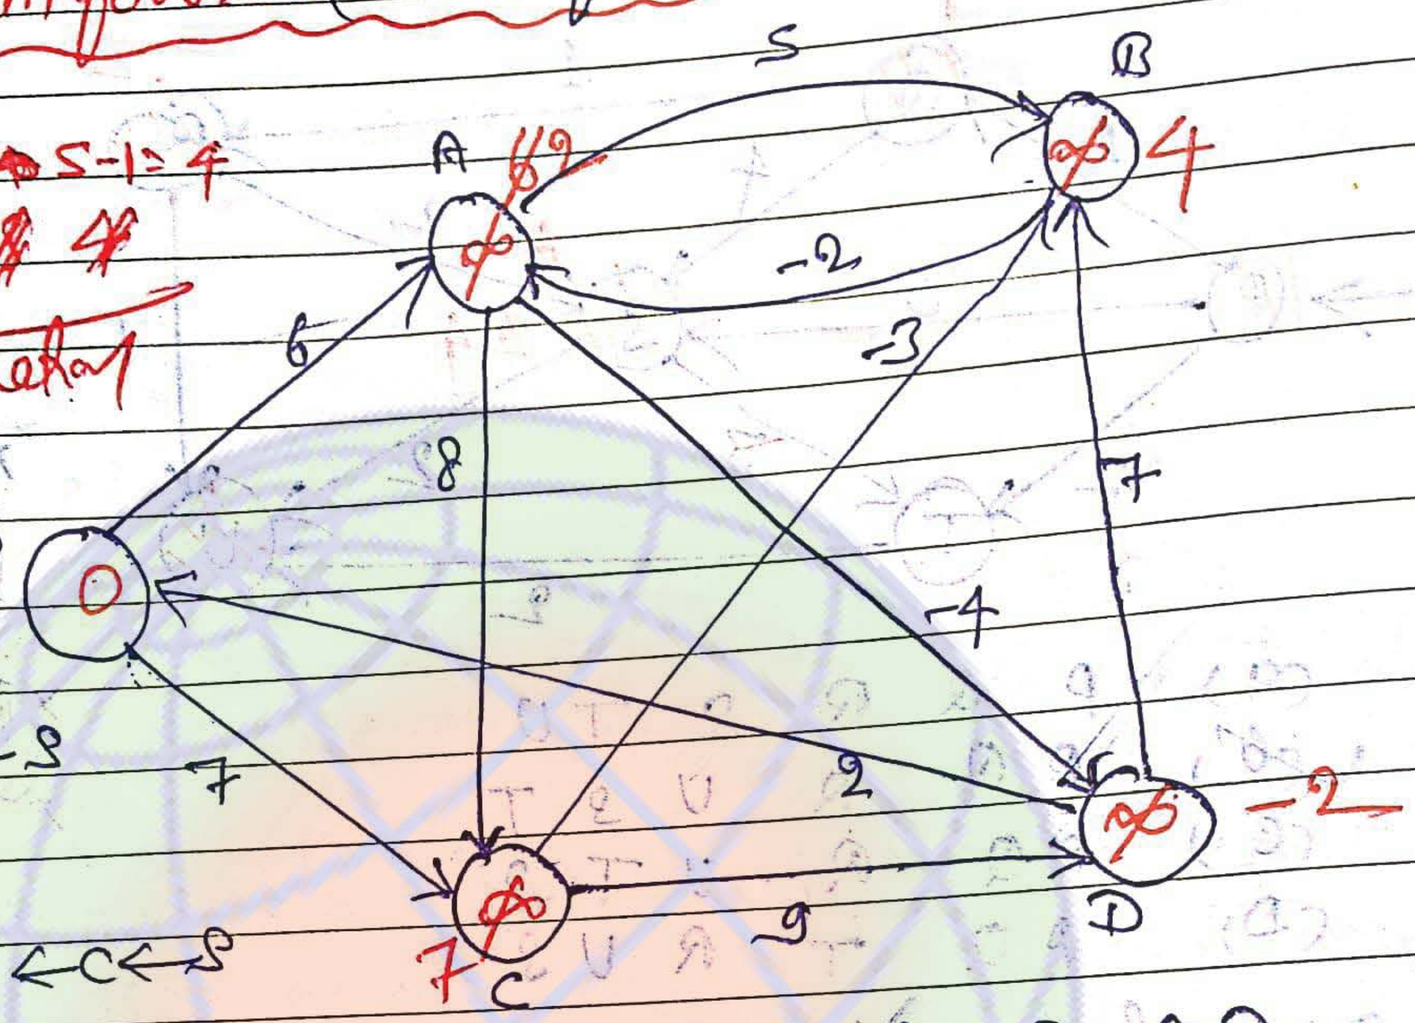
Date __/__/____ Page No.: ____

★ Ballman ford :- (Ballman-ford) :-

n-1 = 5-1 = 4

Q.) ~~4~~ ~~4~~ ~~4~~ 4

4 iteration



Path :-

A ← B ← C ← S

B ← C ← S

C ← S

D ← A ← B ← C ← S

v	S	A	B	C	D
π[v]	—	B	C	S	A
d[v]	0	2	4	7	-2

Bellman ford (G, w, s)

{

Initialize-Single source (G, w, s)

for i ← 1 to |V(G)| - 1

for each edge (u, v) ∈ E(G)

relax (u, v, w)

for each edge (u, v) ∈ E(G)

if [d[v] > d[u] + w(u, v)]

return false

return true

}

Date __/__/____ Page No.: ____

(i) Ballman ford remove the disadvantage of dijkastra and can work on -ve weights.

(ii) -ve weight cycle:-
A cycle is said to be -ve weights if the net/total weight of cycle is -ve or less than zero

(iii) If a graph have -ve weight cycle then ballman ford guarantee detection.

(iv) n-1 iteration are sufficient for a graph which have n-vertices because the longest path length is n-1.

(v) The -ve weight cycle will be detected but it must be rechable.

(vii) Even if all the weight of edge is distinct still there may be different path possible.

(viii) If Cost of all edge weights get doubles then the value of path may change but shortest path will remain same.

Date ___/___/______

Short trick to solve floyd warshell problem.

(i) self loop को Remove कर दें

(ii) अगर दो vertex के बीच दो Path हो तो smallest को select करें

(iii) D_0 → Normal distance को पता करें, तथा T_0 में जो भी Initial vertex हो उसे लिखें।

(Diagonal वाले में Zero ही होगा)

(iv) D_1 → या तो directly vertex 1 को intermediate मान कर find करें या फिर (or) → D_1 → 1st matrix/ D_2 → 2nd

— R0, C0 ले कर उनसे से ∞ वाले number को छोड़ दें।

→ अगर इसमें भी ∞ आ जाए तो उस row या column का सारा element as it is होगा क्योंकि, ∞ में कुछ भी direct जोड़े उससे कोई फर्क नहीं पड़ेगा

like,

for D1 → 3-1-4 → distance from (3 to 4 via 1)

3-1-2 etc., short trick for direct

Date 26/06/2015 Page No.:

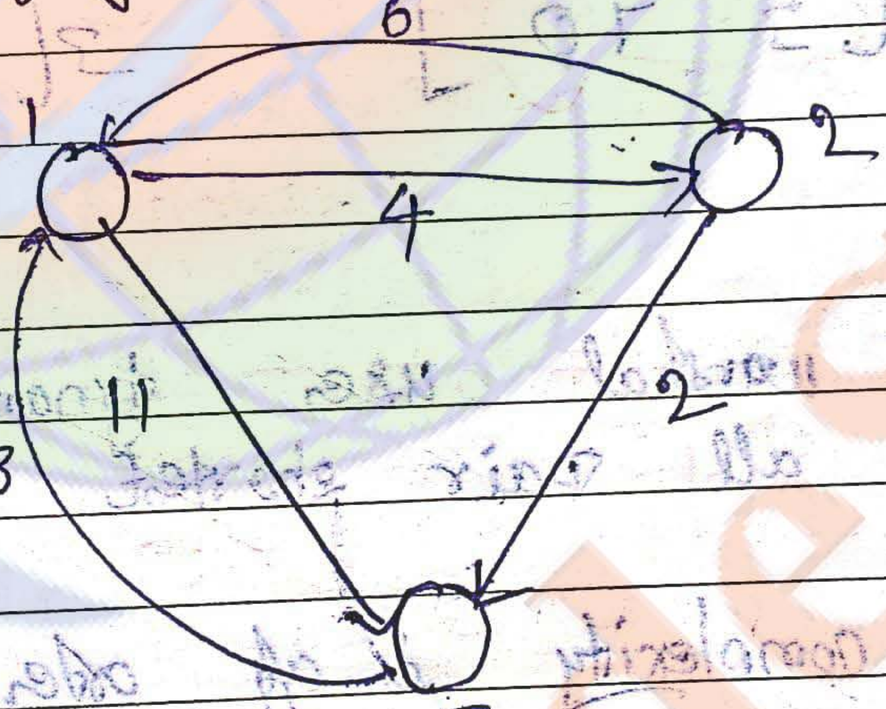
★ All pair shortest path:-

Let G be a directed weighted graph and the problem is to find the shortest distance from every node, to every other node of the graph.

(1) Either this problem can be solve using single source shorted path algorithm, if executed on every vertex. otherwise we can ~~first~~ floyd warshell algo, which uses dynamic Programming strategies to solve this problem.

(1) Floyd warshell algorithm:-

Q:> Consider a graph and find all pair shortest path using floyd warshal algorithm



$$D^0 = \begin{matrix} & 1 & 2 & 3 \\ 1 & 0 & 4 & 11 \\ 2 & 6 & 0 & 2 \\ 3 & \infty & \infty & 0 \end{matrix}$$

$$\Pi^0 = \begin{matrix} & 1 & 2 & 3 \\ 1 & - & 1 & 1 \\ 2 & 2 & - & 2 \\ 3 & - & - & - \end{matrix}$$

Date / /

d_1 =

	1	2	3
1	0	4	11
2	6	0	2
3	3	7	0

when 1 is intermediate

π =

	1	2	3
1	-	1	1
2	2	-	2
3	3	1	-

d^2 =

	1	2	3
1	0	4	6
2	6	0	2
3	3	7	0

when 2 is intermediate

π^2 =

	1	2	3
1	-	1	2
2	2	-	2
3	3	1	-

d^3 =

	1	2	3
1	0	4	6
2	5	0	2
3	3	7	0

when 3 is intermediate (This is final answer)

π =

	1	2	3
1	-	1	2
2	3	-	2
3	3	1	-

(i) Floyd warshal uses dynamic Programming to solve all pair shortest Path.

(ii) Its complexity is of order n^3, $O(n^3)$ and can work only with positive (+ve) weight edge.

(iii) If we have a graph of n-vertices then we require $2(n+1)$ matrix each of order $n \times n$.

Note

Supports negative-edge-weight, but not negative-weight cycle.

$i \le k < j$

$A_{k+1}, A_k \dots A_q$

$i < k \le j$

- optimal structure

Step 1:-

Let there be a chain of matrix from A_i to A_j, suppose we know a optimal value k, such that we have minimum cost to solve A_i to A_k then to solve A_{k+1} to A_j and then the cost of multiplying them together.

And then we can apply this approach in a recursive fasion for A_i to A_k and for A_{k+1} to A_j.

Q) Consider a chain of matrix and find the minimum no. of scalar multiplication requires.

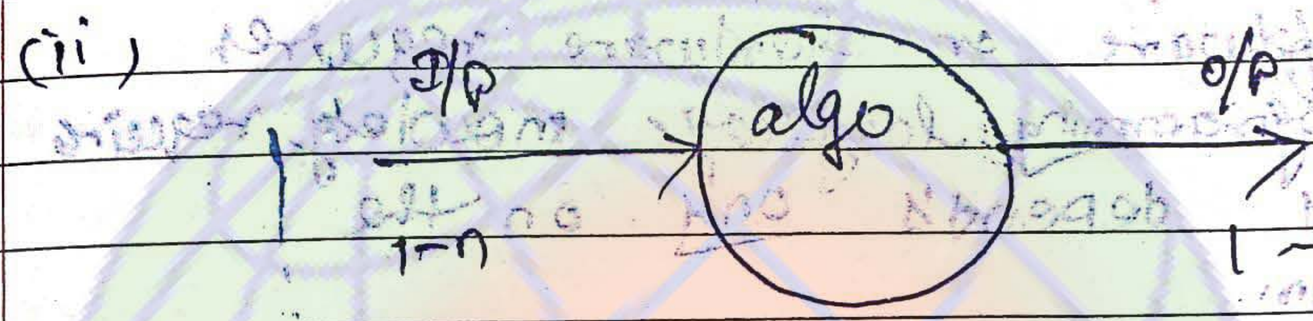
Analysis of algorithm

(i) Algorithm is a step by step procedure to solve a problem and here rough time prediction is also possible.

(The no. of steps will always be finite)

(ii)



The input to any algorithm will range from 0 to n and the output will range from 1 to m

(iii) Before an algorithm is converted into a program using a programming language it is necessary to do analysis of the algorithm

* Why we require analysis?

There are multiple resources which an algorithm requires like time, space, bandwidth, battery power, registers etc. out of which time is the most important criteria on which we will judge a algorithm.

Date __/__/____ Page No.: ____

* There can be two method for analysis of algorithm

(i) Independent or apriori analysis

Here we use special mathematical notation to give a rough time prediction.

Advantage:-
- No software or hardware requires
- No programming language knowledge requires
- Uniformly depends only on the algorithm.

(ii) Experimental analysis (or aposteriori analysis)

Here we convert a algo into a program using a programming language and then find exact time of execution.

Advantage:-
- Exact value, not rough prediction
- No mathematical knowledges requires.

Disadvantage:
Result is affected by many factor like hardware, software and programming language

Date __/__/____ Page No.: ____

* Order of magnitude:-

Order of magnitude of a instruction means how many fundamental ~~instruction~~ operation are requires to execute that instruction or statement

- Consider the following code and identify their order of magnitude/ rough time Prediction

(i) for i ← 1 to n; — $O(n)$
  S', — $O(1)$
$\Rightarrow O(n)$

(ii) for i ← 1 to n — $O(n)$
  for j ← 1 to n — $O(n)$
   S', — $O(1)$
nested → $O(n^2)$

(iii) for i ← 1 to n/2 — $O(n)$
  for j ← 1 to n/8 — $O(n)$
   S', — $O(1)$
nested → $O(n^2)$

(iv) for i ← 1 to n/2 — $O(n)$
  S', — $O(1)$ — $O(n)$
 for i ← 1 to n/16 — $O(n)$

Date __/__/____ Page No.: ____

★ Asymptotic notation:

(i) Asymptotic notations are abstract notations for describing the behaviour of the algorithm and determine their rate of growth.

(ii) The worst case time complexity of algo is that input sequence, for which it takes maximum amount of time.

(iii) Best case:
It is that input sequence, for which the algorithm take minimum time.

(iv) Why we don't study average case?

Ans:- t_1 t_2 ... t_n

E_1, E_2 ---- E_n

P_1 P_2 ... P_n

$$= \sum_{i=1}^{n} P_i * t_i$$

Suppose for a certain problem, there exist i_1 to i_n different input cases having probability from P_1 to P_n, where each take time t_1, t_2 ---- t_n respectively.
So, the final avg. case time will be

$$A(n) = \sum_{i=1}^{n} P_i * t_i$$

Date / /

Page No.:

As it takes extremly large amount of time to compute this value, so it is not possible to study average case.

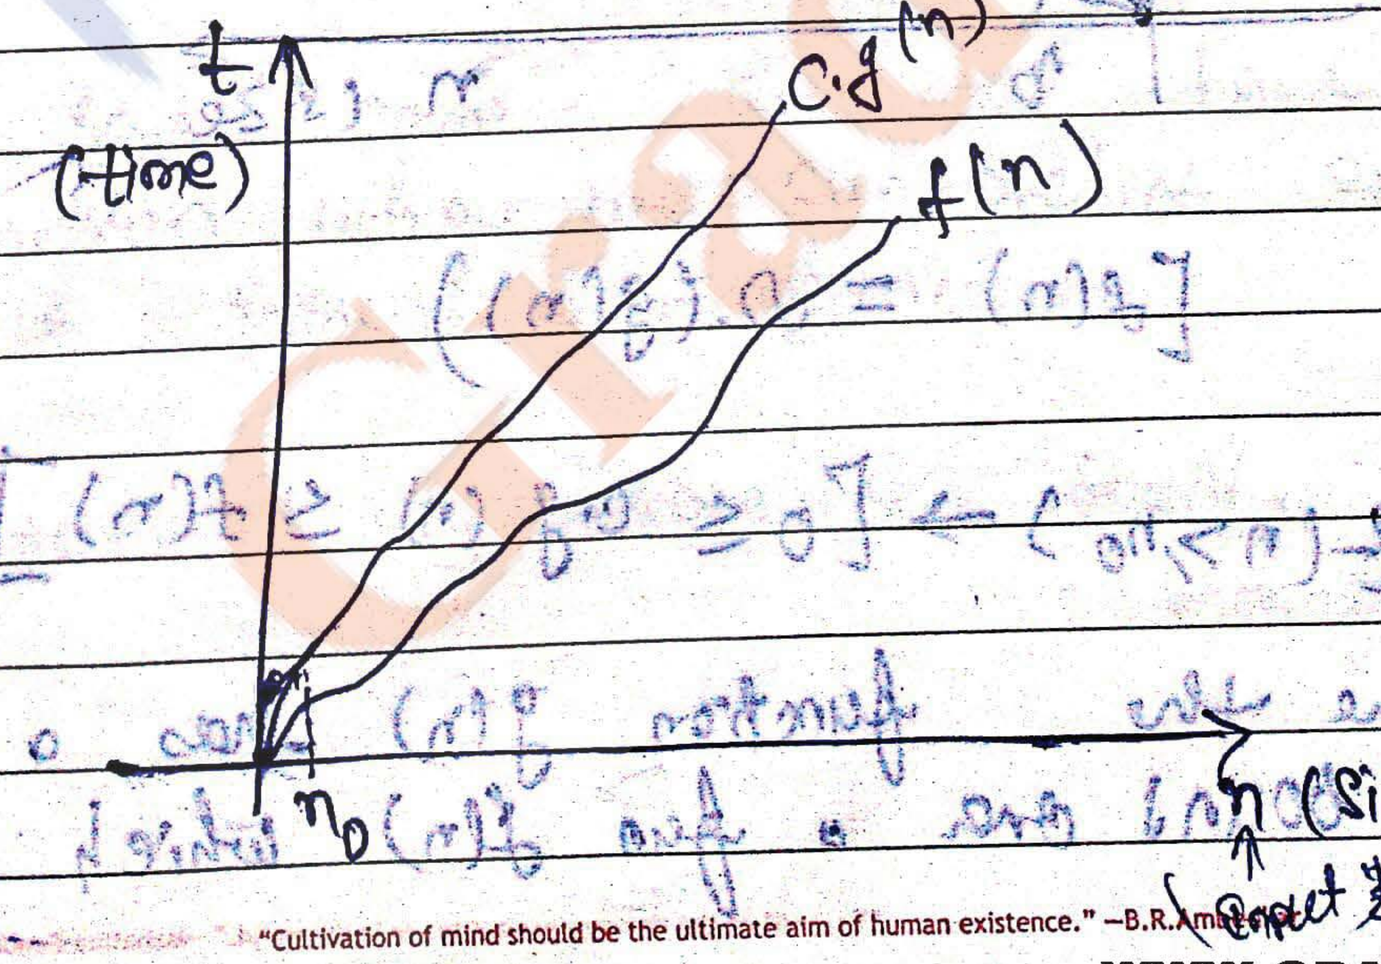
* Types

- Asymptic notation are of two types.

  - big notation
    - Big - oh (O)
    - Big - theta (Θ)
    - Big - omega (Ω)
  - small notation
    - small-oh(o)
    - small omega(ω)

(i) Big notations -

(ii) Big-oh(O) : -



Date __/__/____ Page No.: ____

By O, will always with big.

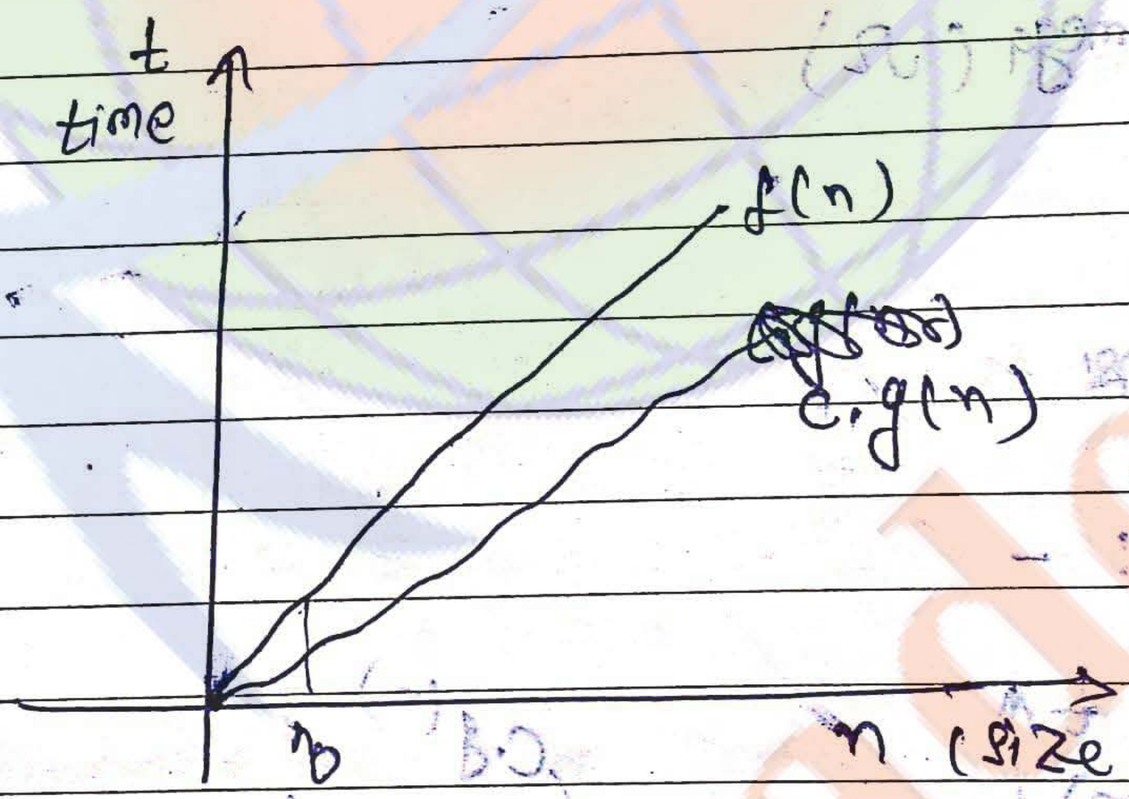
$$f(n) = O(g(n)) \rightarrow [0 \le f(n) \le c.g(n)]$$

This representation means that the upper bound of function $f(n)$ is $g(n)$ and $f(n)$ can be min to zero but always will less than $c.g(n)$. holds when $n \ge n_0$.

Q. what is c ?

Ans. c is any positive constant.

(ii) Big-omega (Ω)



$$f(n) = \Omega(g(n))$$

$$t(n \ge n_0) \rightarrow [0 \le c.g(n) \le f(n)]$$

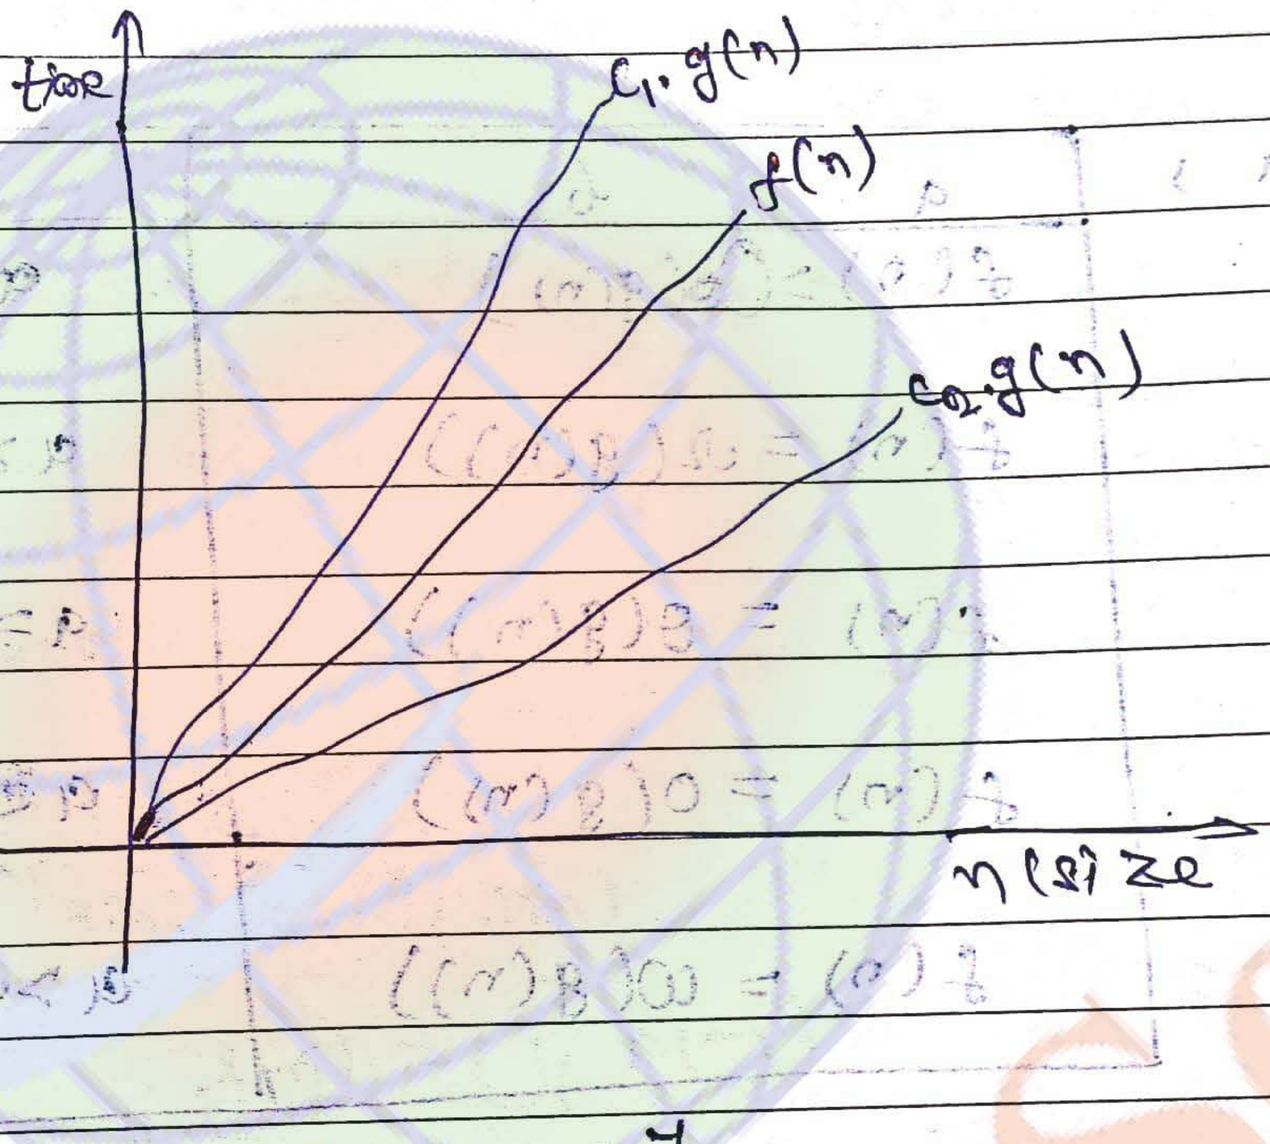
Here the function $g(n)$ has a lower bound over a fun $f(n)$ which mean's

Date __/__/____ Page No.: ____

can be min, be greater than equal to $c_1 g(n)$ where

c_1 a positive constant and satisfy in all cases where $n \geq n_0$

(iii) Big-theta(Θ) :-



$$[f(n) = \Theta(g(n)]$$

$$[0 \leq c_2 g(n) \leq f(n) \leq c_1 g(n)]$$

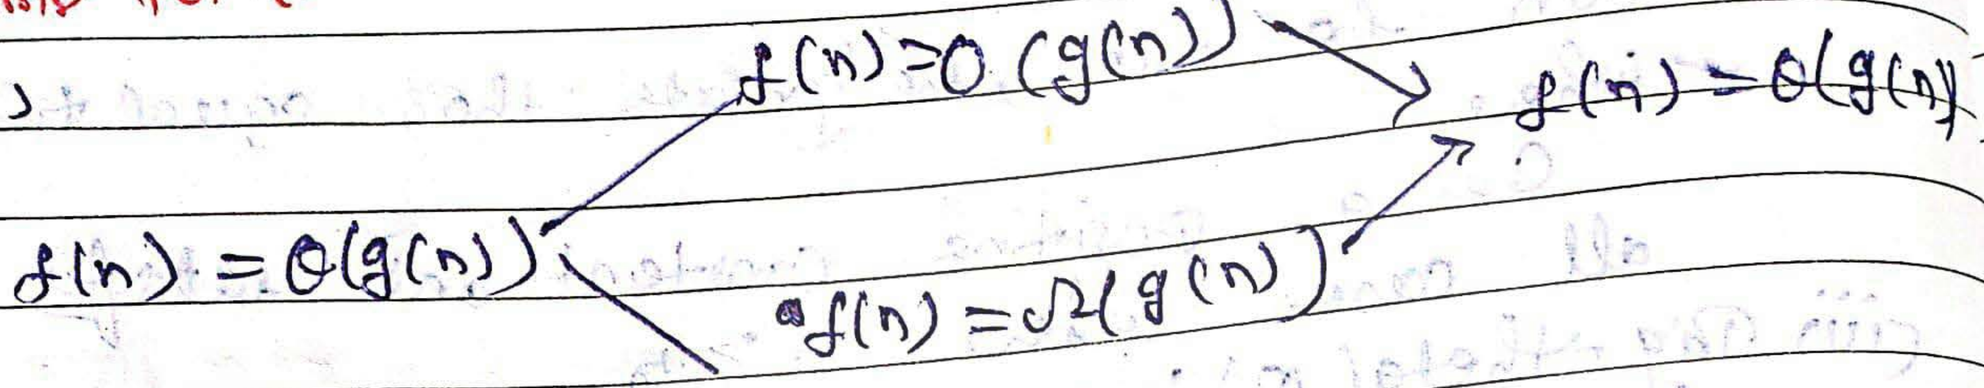
In the best case we may have a function where we can predict exactly what is growth of a function.

It is denoted by theta(Θ) bound.

Date ___/___/_____

Imp Point :-

(i)



a > b
b > c
a > c

(ii)

a	b
$f(n) = \Theta(g(n))$	$a \leq b$
$f(n) = \Omega(g(n))$	$a \geq b$
$f(n) = \Theta(g(n))$	$a = b$
$f(n) = o(g(n))$	$a < b$
$f(n) = \omega(g(n))$	$a > b$

(iii) trichotomy

In trichotomy, if there are two number then one of the following always hold good, either

$a < b$

$a > b$

$a = b$

But it is not necessary in case of function

$f(n) < g(n)$

$f(n) > g(n)$

$f(n) = g(n)$

"You must be the change you want to see in the world." –Mahatma Gandhi

Date __/__/____ Page No.: _____

eg. sino, cose)

07 Big-O satisfy reflexivity :-

$f(n) = O(f(n))$ → Big-O, Big-theta, Big-omega.

(iv) Big-notations satisfy reflexivity

(v) only theta satisfy symmetry.

(vi) Transitivity:-

$f(n) = (g(n))$

$g(n) = O(g(n)$

$g(n) = O(p(n))$

All the five notations, support's transitivity.

(vii) $f(n) = O[g(n)]$

↓

$a \cdot f(n) = O(g(n))$

If this is true then this is also true, where a is any positive constant.

(viii) If $f(n) = O(g(n))$; $p(n) = O(q(n))$

then (a) $f(n) \cdot p(n) = O(g(n) \cdot q(n))$

(b) $f(n) \cdot p(n) = O(\max[g(n), q(n)])$

Date ___/___/_____ Page No.: _____

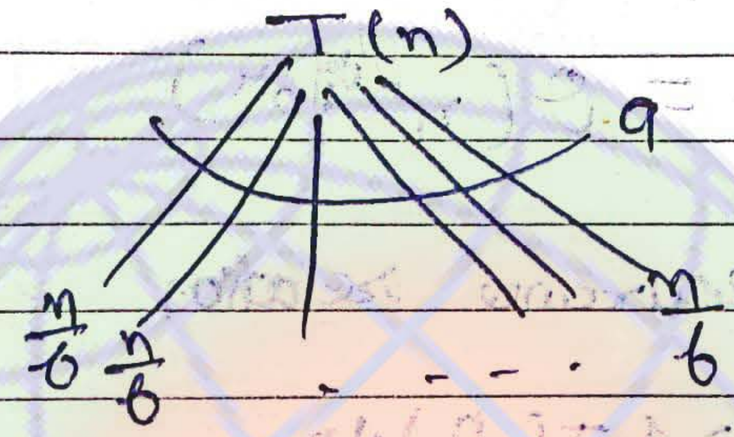
★ Master Theorem :-

$$T(n) = a\,T\left(\frac{n}{b}\right) + f(n)$$



- It's a divide and conquer approach.

T(n)

a → $a \geq 1$

$T\left(\frac{n}{2}\right)$ → $b > 1$ → If we take 1, then we not do any work, so we need to take value greater than 1, in case of b.

- This means mean's, there is a problem of size "n" which is difficult to be solves directly so, we divides into "a" number of problems, so that each problem has a size of $\frac{n}{b}$, where f(n) is the cost of dividing the problem into subproblem and then combining these sub-soln into final soln

Date __/__/____ Page No.:

Condition! –

Condition 1st! - If $f(n) = O(n^{\log_b a - \epsilon})$ $\epsilon > 0$ (else if)

If $f(n) = O(n^{\log_b a - \epsilon})$ $\epsilon > 0$

$T(n) = \Theta(n^{\log_b a})$.

eg 1) Consider a recurrence relation

$T(n) = 4T(\frac{n}{2}) + n$

$a = 4, b = 2, f(n) = n$

$n = O(n^{\log_2 4 - \epsilon})$

$n = O(n^{2-\epsilon})$ → need to prove it

$n = O(n^{1-\epsilon})$ $\epsilon > 0$

$T(n) = \Theta(n^2)$

eg 2) $T(n) = 8T(\frac{n}{2}) + n^2$

$a = 8, b = 2, f(n) = n^2$

$n^2 = O(n^{\log_2 8 - \epsilon})$

$n^2 = O(n^{3-\epsilon})$ → needs to follow it

$\epsilon = (-2)$ → $\epsilon > 0$ को ये काम

$T(n) = \Theta(n^3)$

Date __/__/____ Page No.: _____

Q3) Consider a relⁿ

$$T(n) = 2T\left(\frac{n}{2}\right) + n \log_2 n$$

Sol^n

$$a = 2, \quad b = 2, \quad n = n \log_2 n$$

$$n \log n = O(n^{\log_2 2 - \epsilon})$$

$$n \log_2 n = O(n^{1-\epsilon})$$

$\epsilon > 0$

$\epsilon = 0$

As here condition 1 fails, so, we will go for condition 2.

↓

Condition 2nd:-

If $f(n) = \Theta(n^{\log_b a} \cdot (\log_2 n)^k) \quad k \geq 0$

$$T(n) = \Theta(n^{\log} \cdot \log n^{k+1})$$

So, Apply for above question

$$a = 2, \quad b = 2, \quad f(n) = n \log_2 n$$

$$f(n) = \Theta(n^{\log_b a} \cdot (\log n)^k)$$

$$n \log n = \Theta(n^1 \cdot (\log n)^{k=1})$$

$$T(n) = \Theta(n (\log n)^2)$$ Ans

Date ___/___/_____

$$\log_b a = \frac{\log_{10} a}{\log_{10} b}$$

Page No.: _____

Q Consider a recurance

$$T(n) = 7T\left(\frac{n}{2}\right) + n^2 \rightarrow$$

$a = 7, \quad b = 2, \quad n = n^2$

$$n^2 = O(\log_2^{7-\epsilon})$$

$$n^2 \geq O(\log_2^{7-\epsilon})$$

Not equal to possible

So, condition 1 is false,

So we need to apply condition 2

$$T(n) = O(n^{\log_2 7})$$

$$= O(n^{2.81})$$

Ans

$a \geq 7, \quad b \geq 2, \quad f(n) \neq O$

Q> $T(n) = 7T\left(\frac{n}{2}\right) + n^2$

Q>

8/7

MTech ✗ Research → ✗
Teaching → ✓

Date __/__/____ Page No.: ____

a) $T(n) = T(\frac{n}{3}) + n$

b) $a = 1, \quad b = 3, \quad f(n) = n$

$f(n) = O(n^{\log_3 1 - \epsilon})$

$n = O(n^{\log_3 1 - \epsilon})$ ✗

~~$f(n) = O(n^{\log_3 1})$~~ Condition 1 fail

Condition 2:-

$f(n) = O(n^{\log_3 1} \cdot (\log n)^k) \quad k \geq 0$

$= O(n^{\log_3 1} \cdot (\log n))$

$= O(n^{\log_3 1} \cdot 1)$

Condition 2 fails.

So, we need to see 3rd condition

Condition 3:-

If $f(n) = \Omega(n^{\log_b a + \varepsilon}) \quad \varepsilon > 0$

$\hookrightarrow a \cdot f(\frac{n}{b}) \leq c \cdot f(n) \quad c < 1$

$\hookrightarrow T(n) = \Theta(f(n))$

For we solve above,

Date ___/___/_____ Page No.: _____

$a = 1, \quad b = 3 \quad f(n) = n$
